

Mojaloop vNext PI 22 Update

28 Jun 2023
vNext Team

Agenda

- **Mojaloop vNext Introduction**
- **Progress Update**
- **Demo**
- **Next Steps**

Mojaloop vNext Introduction

What is Mojaloop vNext?

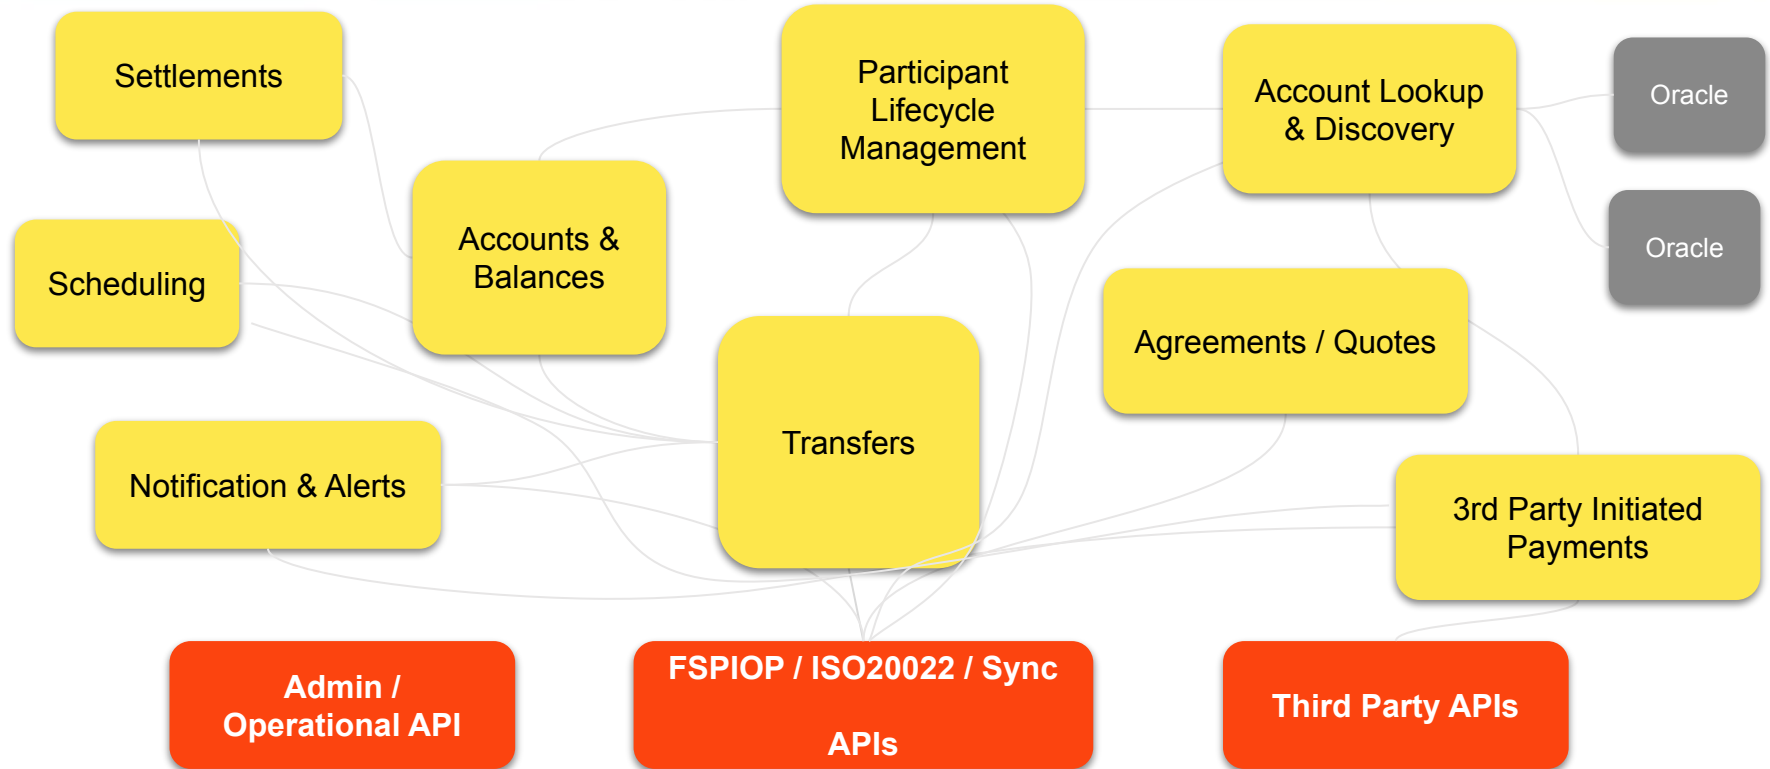

Mojaloop vNext is the strict implementation
of the **agreed Reference Architecture**,
designed around its bounded context approach

What is Mojaloop vNext?

- Different architecture, built in parallel, codenamed vNext
- Same feature set, a future version, maybe v20?
- From the outside it is exactly the same FSPIOP v1.1 API
- When vNext is released, it will have a standard upgrade mechanism, SI's will have the ability to start working on custom upgrades as soon as alpha version is released

Bounded Context Approach

Mojaloop vNext build progress update

Team focus in PI 21

Non-happy paths

Settlements Enhancements

Net Debit Cap

Test Coverage and Documentation

CI/CD Pipelines and Deployment

Alpha version release

Feature progress so far

Business Main Use Cases

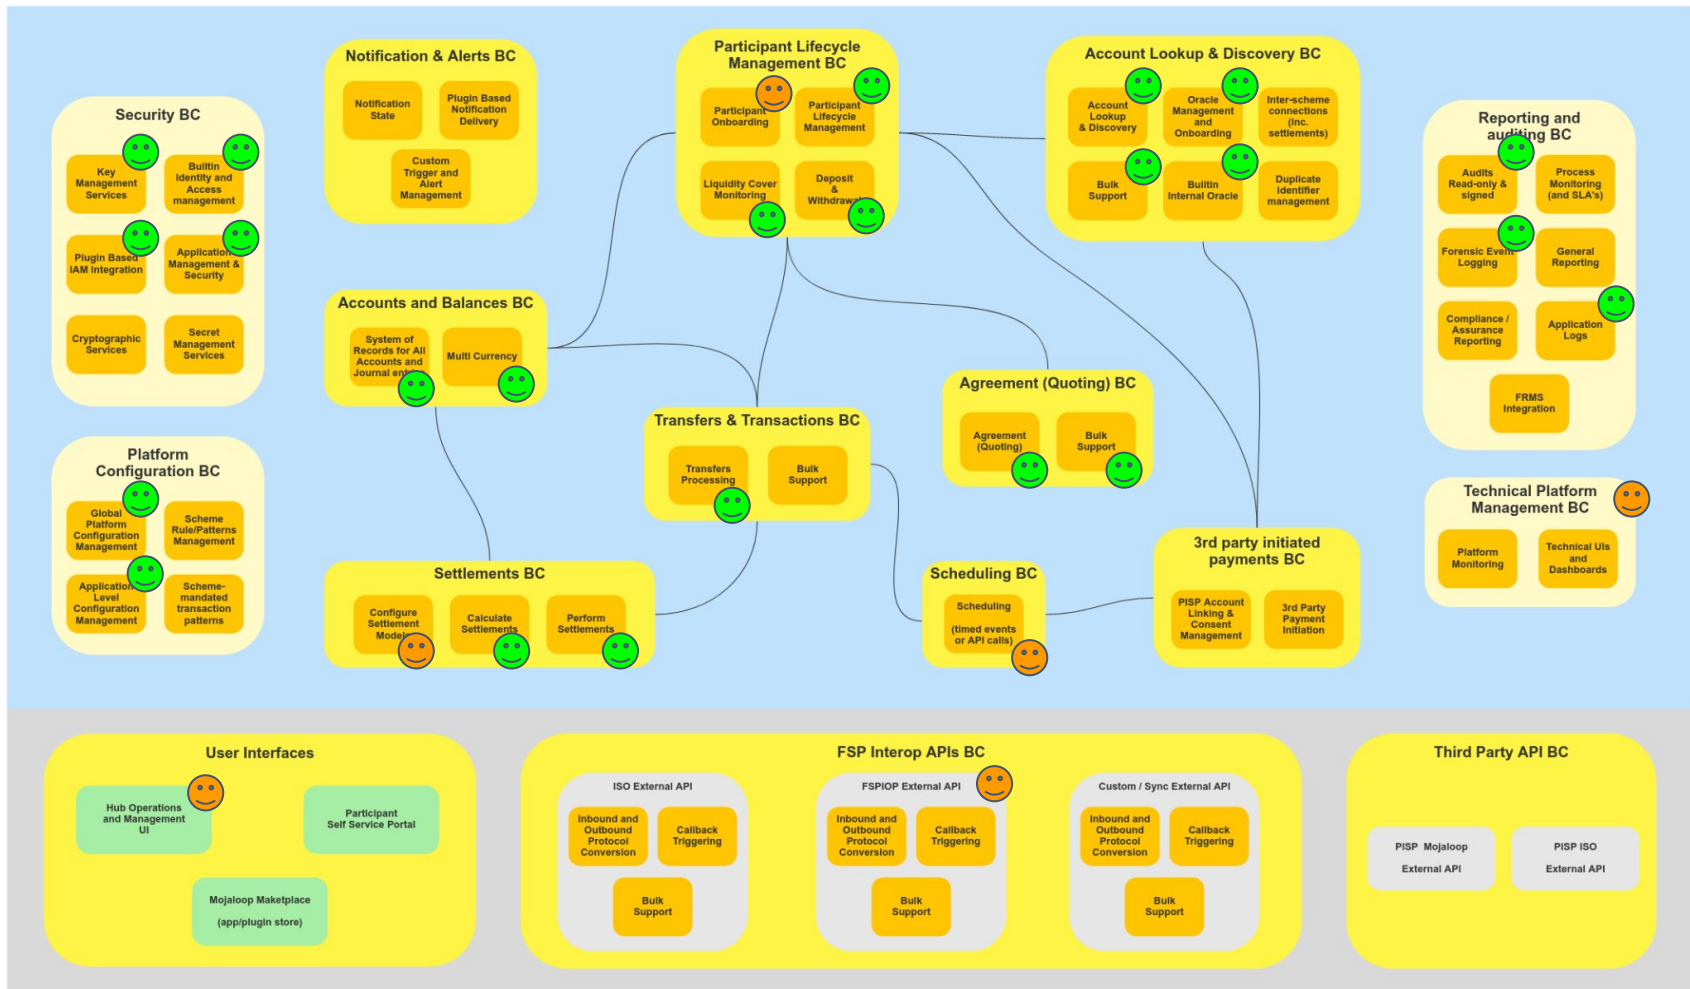

- **Onboarding** - Hub and participants - DONE
- **Lookups** - ALS, Built-in Oracles, Remote Oracle - DONE
- **Quoting** - Single and Bulk - DONE
- **Clearing** - Transfer prepare and fulfil - DONE
- **Settlements** - Gen, querying and exec/settling of Matrix - DONE
- **Accounts & Balances CoA** - TigerBeetle or Built-in Ledger - DONE

Feature progress so far

CrossCutting Concerns Main Use Cases

- **Authentication** - Built-in and external IAM Adapter - DONE
- **Authorization** - Fine Permissions, RBAC and Maker Checker - DONE
- **Platform Configuration** - Config changes without redeploying - DONE
- **Auditing** - Dual stage envelope and crypto signature - DONE
- **Logging** - Central logging facility with plugable storage - DONE
- **Admin APIs and UI** - Onboarding, Lookups, Quotes, Transfers, Settlements, Configs, Security, Operational reports, etc - WIP

Live Demo

Demo Notes

Test calls and screens are **only enabled in development/test mode**

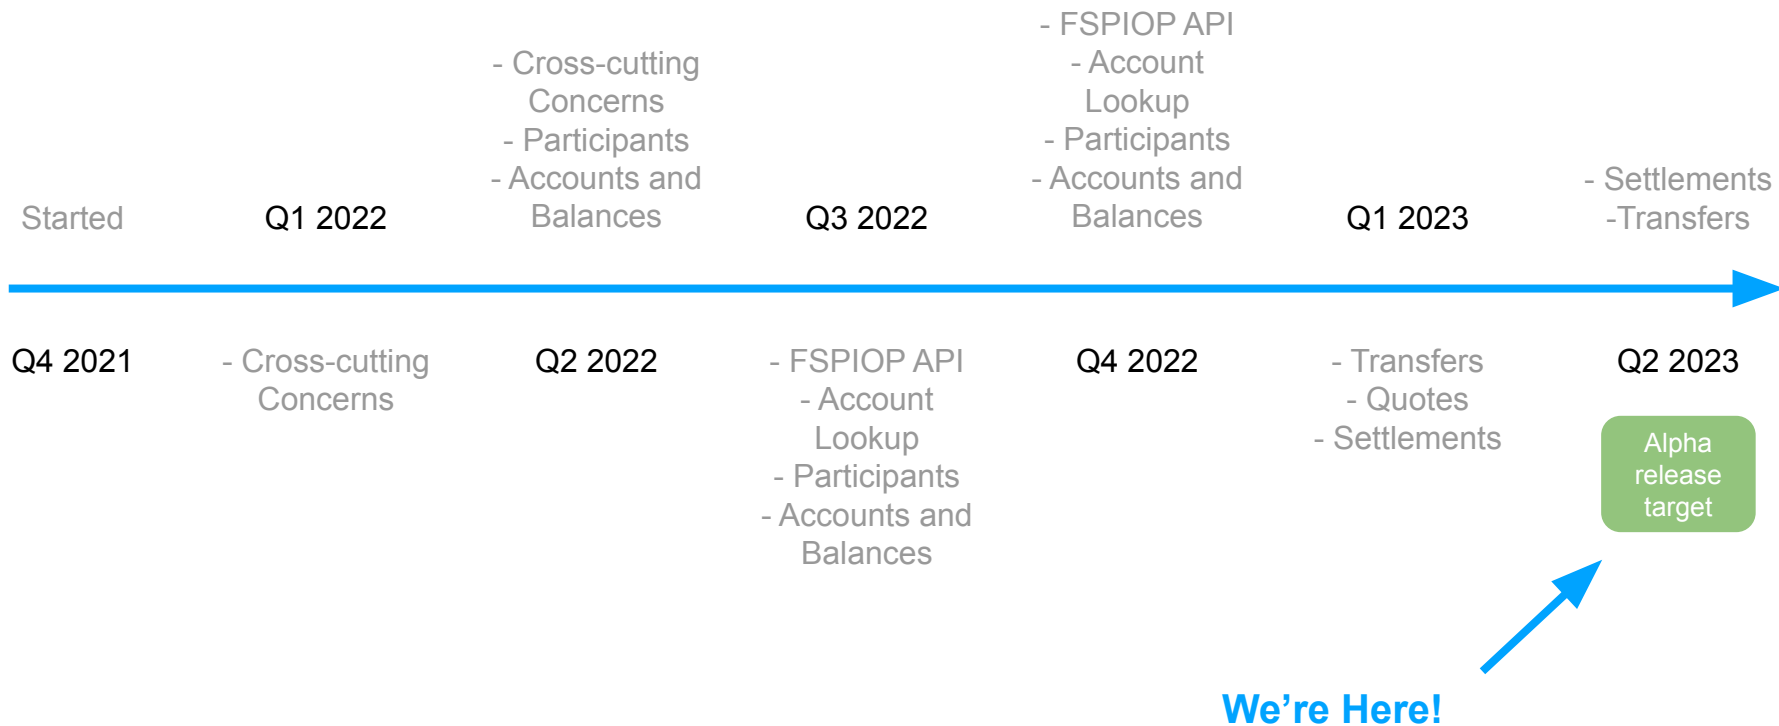

All requests to and from the Mojaloop vNext have
been going **through the FSPIOP API**

We'd like to get started with an PoC implementation of the
ISO20022 API as soon as possible

When can you use it?

Promised Roadmap

Alpha release is ready!

You can test it now!

mini-loop-vnext - for everyone

<https://github.com/mojaloop/mini-loop/tree/vnext-alpha>

docker-compose - for devs

<https://github.com/mojaloop/platform-shared-tools/tree/main/packages/deployment>

What's in the Alpha release?

**Happy paths and most non-happy paths for
all main use cases - inc. cross cutting**

- **Onboarding** - Hub and participants
- **Lookups** - ALS, Built-in Oracles, Remote Oracle
- **Quoting** - Single and Bulk
- **Clearing** - Transfer prepare and fulfil
- **Settlements** - Generation, querying and execution/settling of Matrix
- **Accounts & Balances CoA** - Backed by TigerBeetle or Built-in Ledger

Does it work?

Download Report

11 / 11

How does it perform?

Very early test runs - this is alpha!

- 1 hour long with less than 1% above 1 sec
- Internal message based tests, with simulators (JMeter soon)
- Logs, audits, security and settlements enabled
- Optimizations not yet performed
- Single instance, minimal install
- Using the built-in ledger implementation

How does it perform?

~100

transfers per sec

~500

lookups per sec

(get party and get participant)

How does it perform?

What's missing from Alpha?

- Certificate and JWS validation - Already designed
- Transfers Timeouts - WIP
- Bulk Transfers
- Proper Performance Optimizations
- Custom Notifications
- More tests, more code cleanup and better documentation

What's missing from Alpha?

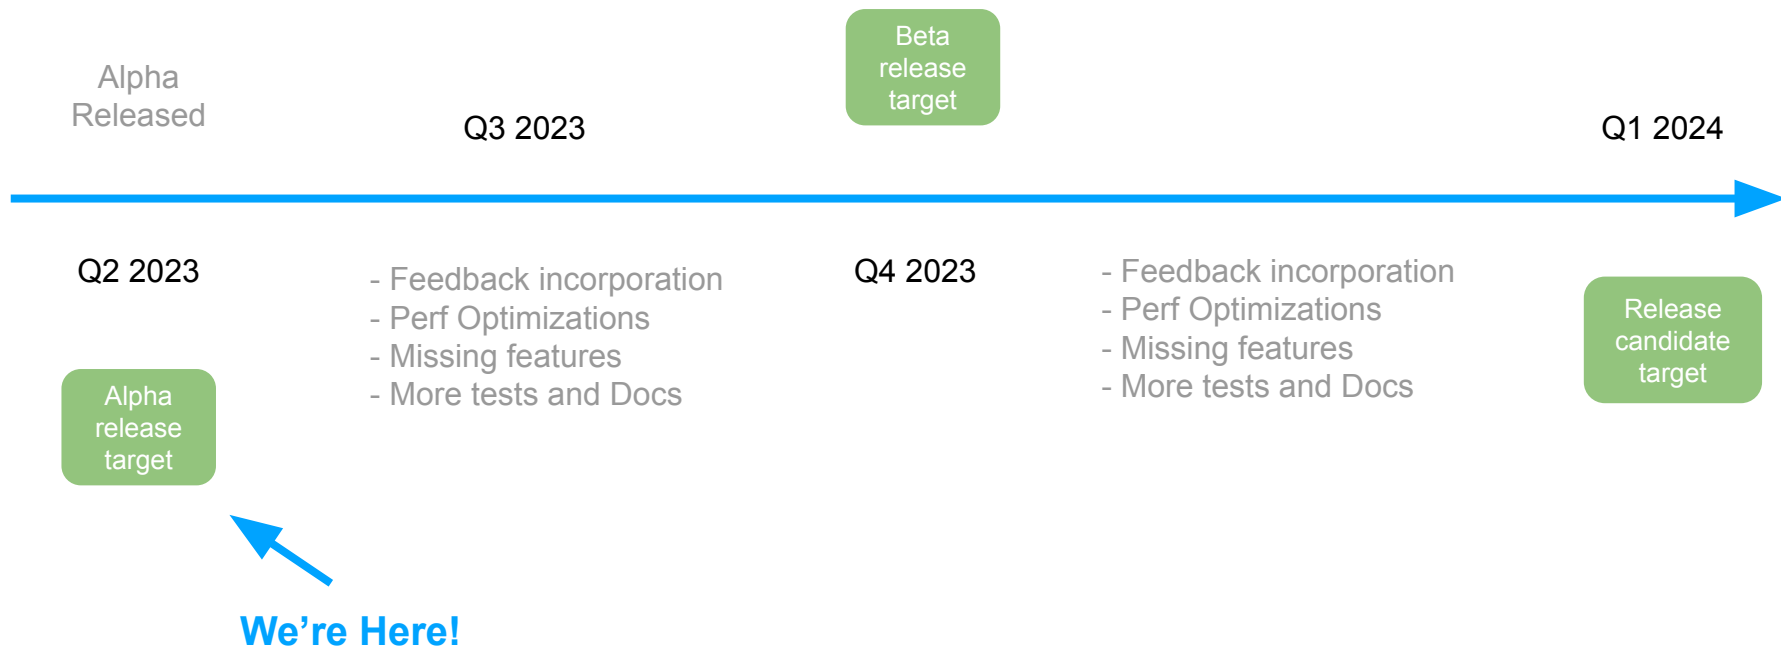

**Feedback from
Brave Implementers
willing to try it!**

Next Steps

Roadmap to Production (WIP)

How we work

Fortnightly Workshops - Thursdays at 11:00 UTC

For developers - snapshot releases for docker compose and K8s available in
GitHub

For non-developers - mini-loop:

<https://github.com/mojaloop/mini-loop/tree/vnext-alpha>

 **slack #vnext-build**

Team work - Thank you!
