

# Mifos Updates

**Building an Entire Digital Financial Services  
Ecosystem on Open Source**

Edward Cable, The Mifos Initiative  
Istvan Molnar, DPC Consulting

# Agenda

- Who We Are
- Community Need
- Our Assets & Value We Bring
- Why Open Matters
- Go Farther Together
- Demo & Technical Updates
  - Performance Testing
  - ISO 20022 to Mojaloop
  - P2P Transfer & Zeebe Modeler
  - DFSP Operational Control Center

# Mifos Initiative & DPC

- 501(c)3 non-profit guiding Mifos OS community advancing Apache Fineract
- Stewards of roadmap & collaborative center
- Industry thought leader & HFOSS pioneer since 2006
- Guide Ecosystem of Solutions & Network of Partners
- 20 million clients reached across 400 orgs
- 20+ years in IT training, consultancy, software development
- Experience with Instant Payment Systems (Singapore FAST, Hungary HCT Inst, SEPA Instant)
  - Including clearing house solutions, payment hubs, shadow balance solutions from key vendors
  - Developing central clearing house prototype, simulator for participants, payment hub

## Financial Inclusion Community of Practice

United  
Nations

mojaloop

Mifos.<sup>®</sup>

Apache Fineract

OpenG2P

- Advance the Secretary General's digital cooperation roadmap to achieve greater financial inclusion and meet the SDGs by 2030.
- Financial Inclusion CoP spent the last few months identifying & shortlisting technologies that, in a given country, can be used by a range of service providers and innovators
- Technologies can be built on across sectors and have features that allow countries to freely adopt & iterate them to meet local needs

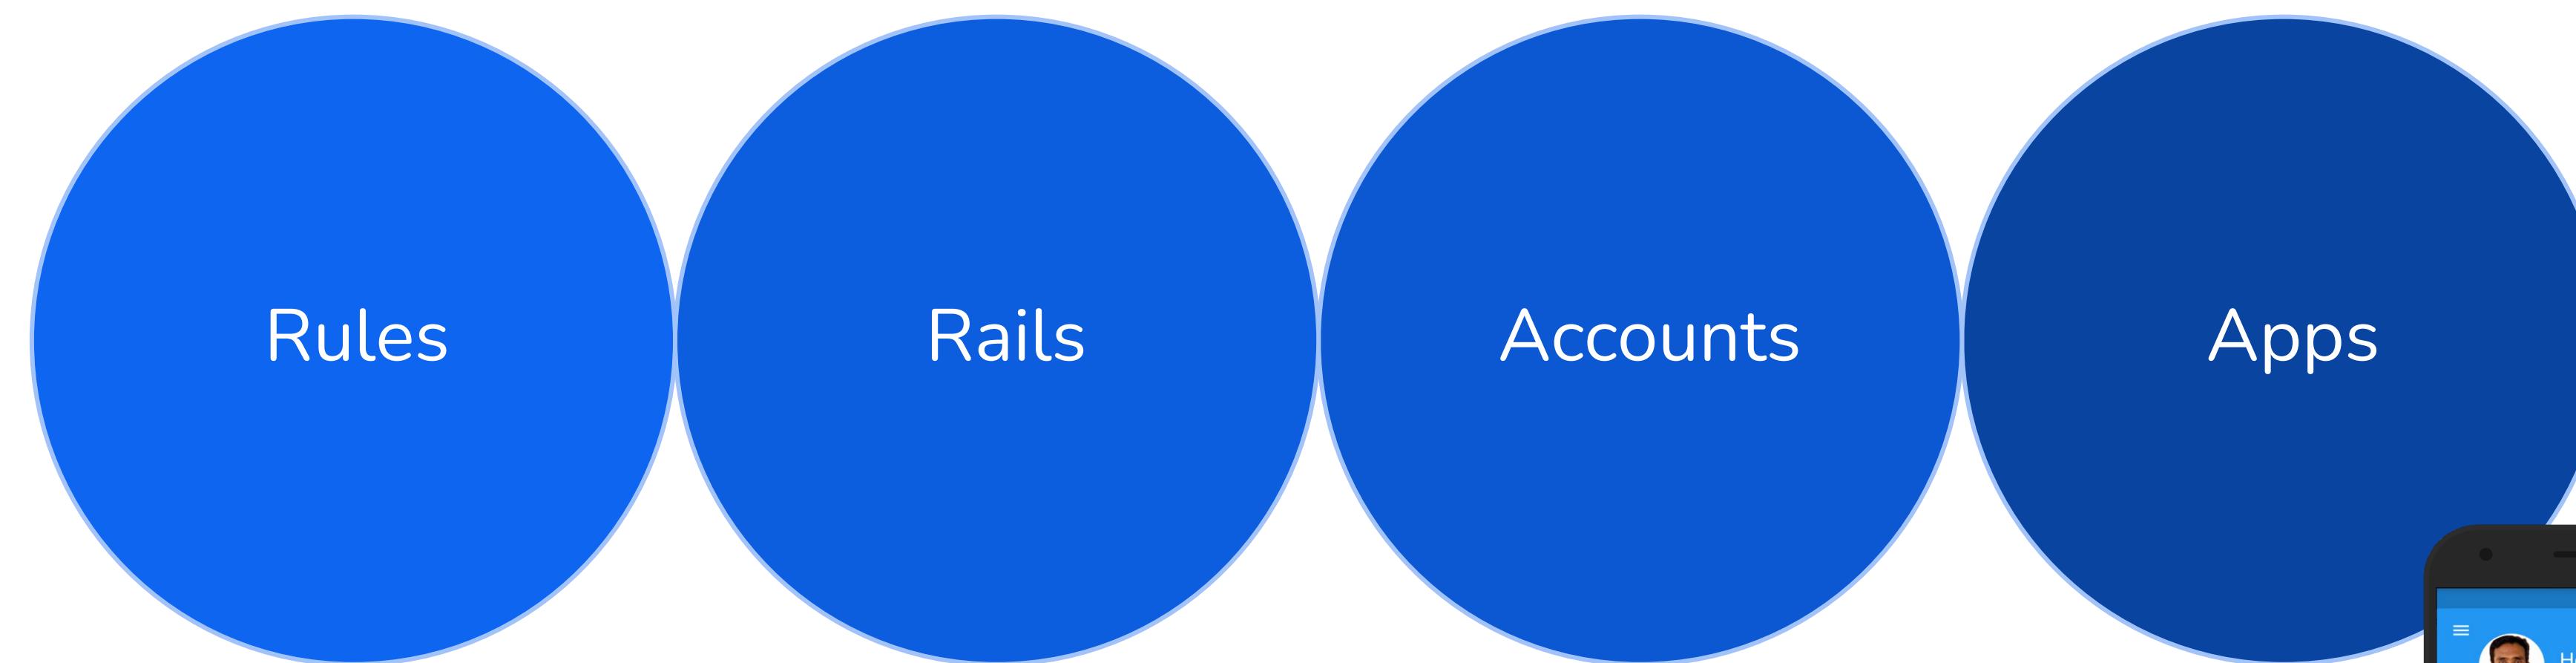

Digital Public Goods are defined by the UN Secretary-General's [Roadmap for Digital Cooperation](#) as "*open-source software, open data, open artificial intelligence models, open standards and open content that adhere to privacy and other applicable international and domestic laws, standards and best practices and do no harm.*"

Digital Public Infrastructure (DPI): *the rails that other solutions "run on top of"* and their implementation typically enables many other solutions and business models to flourish.

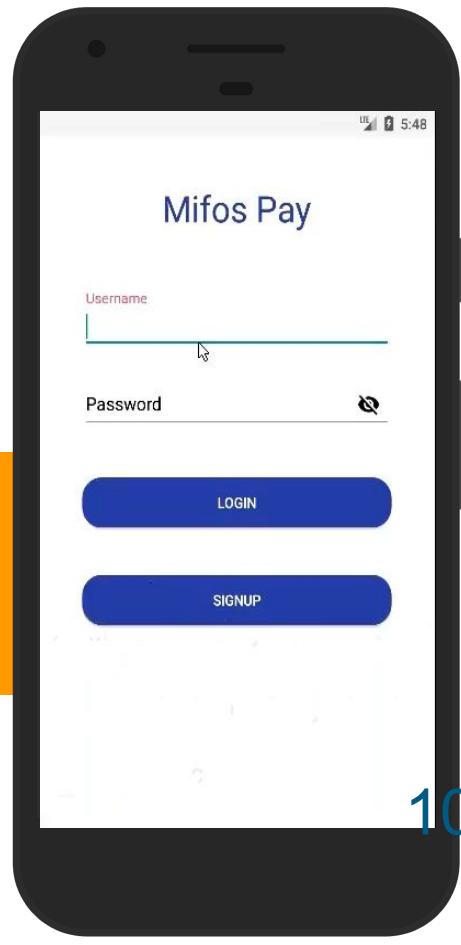

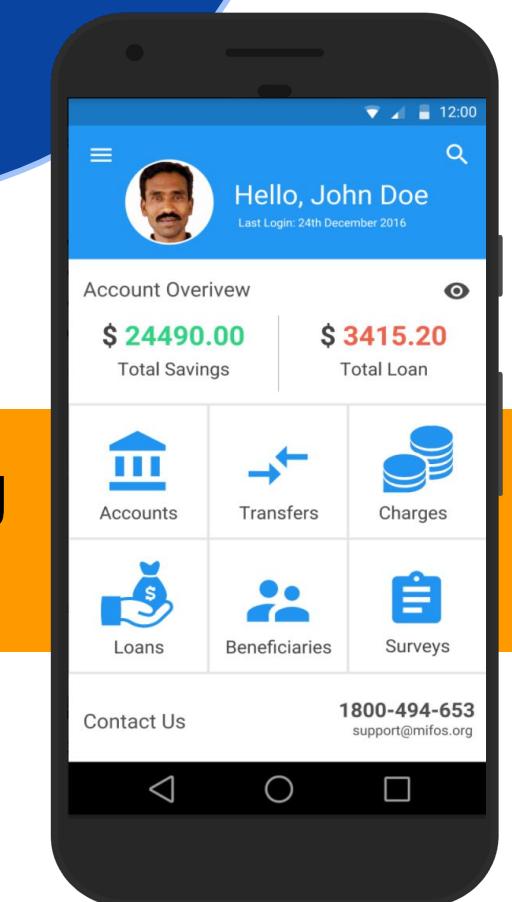

# End to End Open Source Stack for Digital Financial Services

## . Open Stack

- OS L1-Aligned Payment Switch - Mojaloop
- OS Bridge - Payment Hub
- OS Account Management System - Mifos/Fineract
- OS Reference Mobile Apps - Mobile Banking, Mobile Wallet

Open Banking  
APIs

# Open Technology Stack for DFS Innovation

## Platform & APIs

The Mifos Application Framework is built around a central cloud icon containing a hexagonal network. The framework consists of several interconnected modules represented by hexagons:

- Security
- Audit
- TX Processing
- Portfolio
- Reporting
- Accounting
- Organization
- CRM / KYC

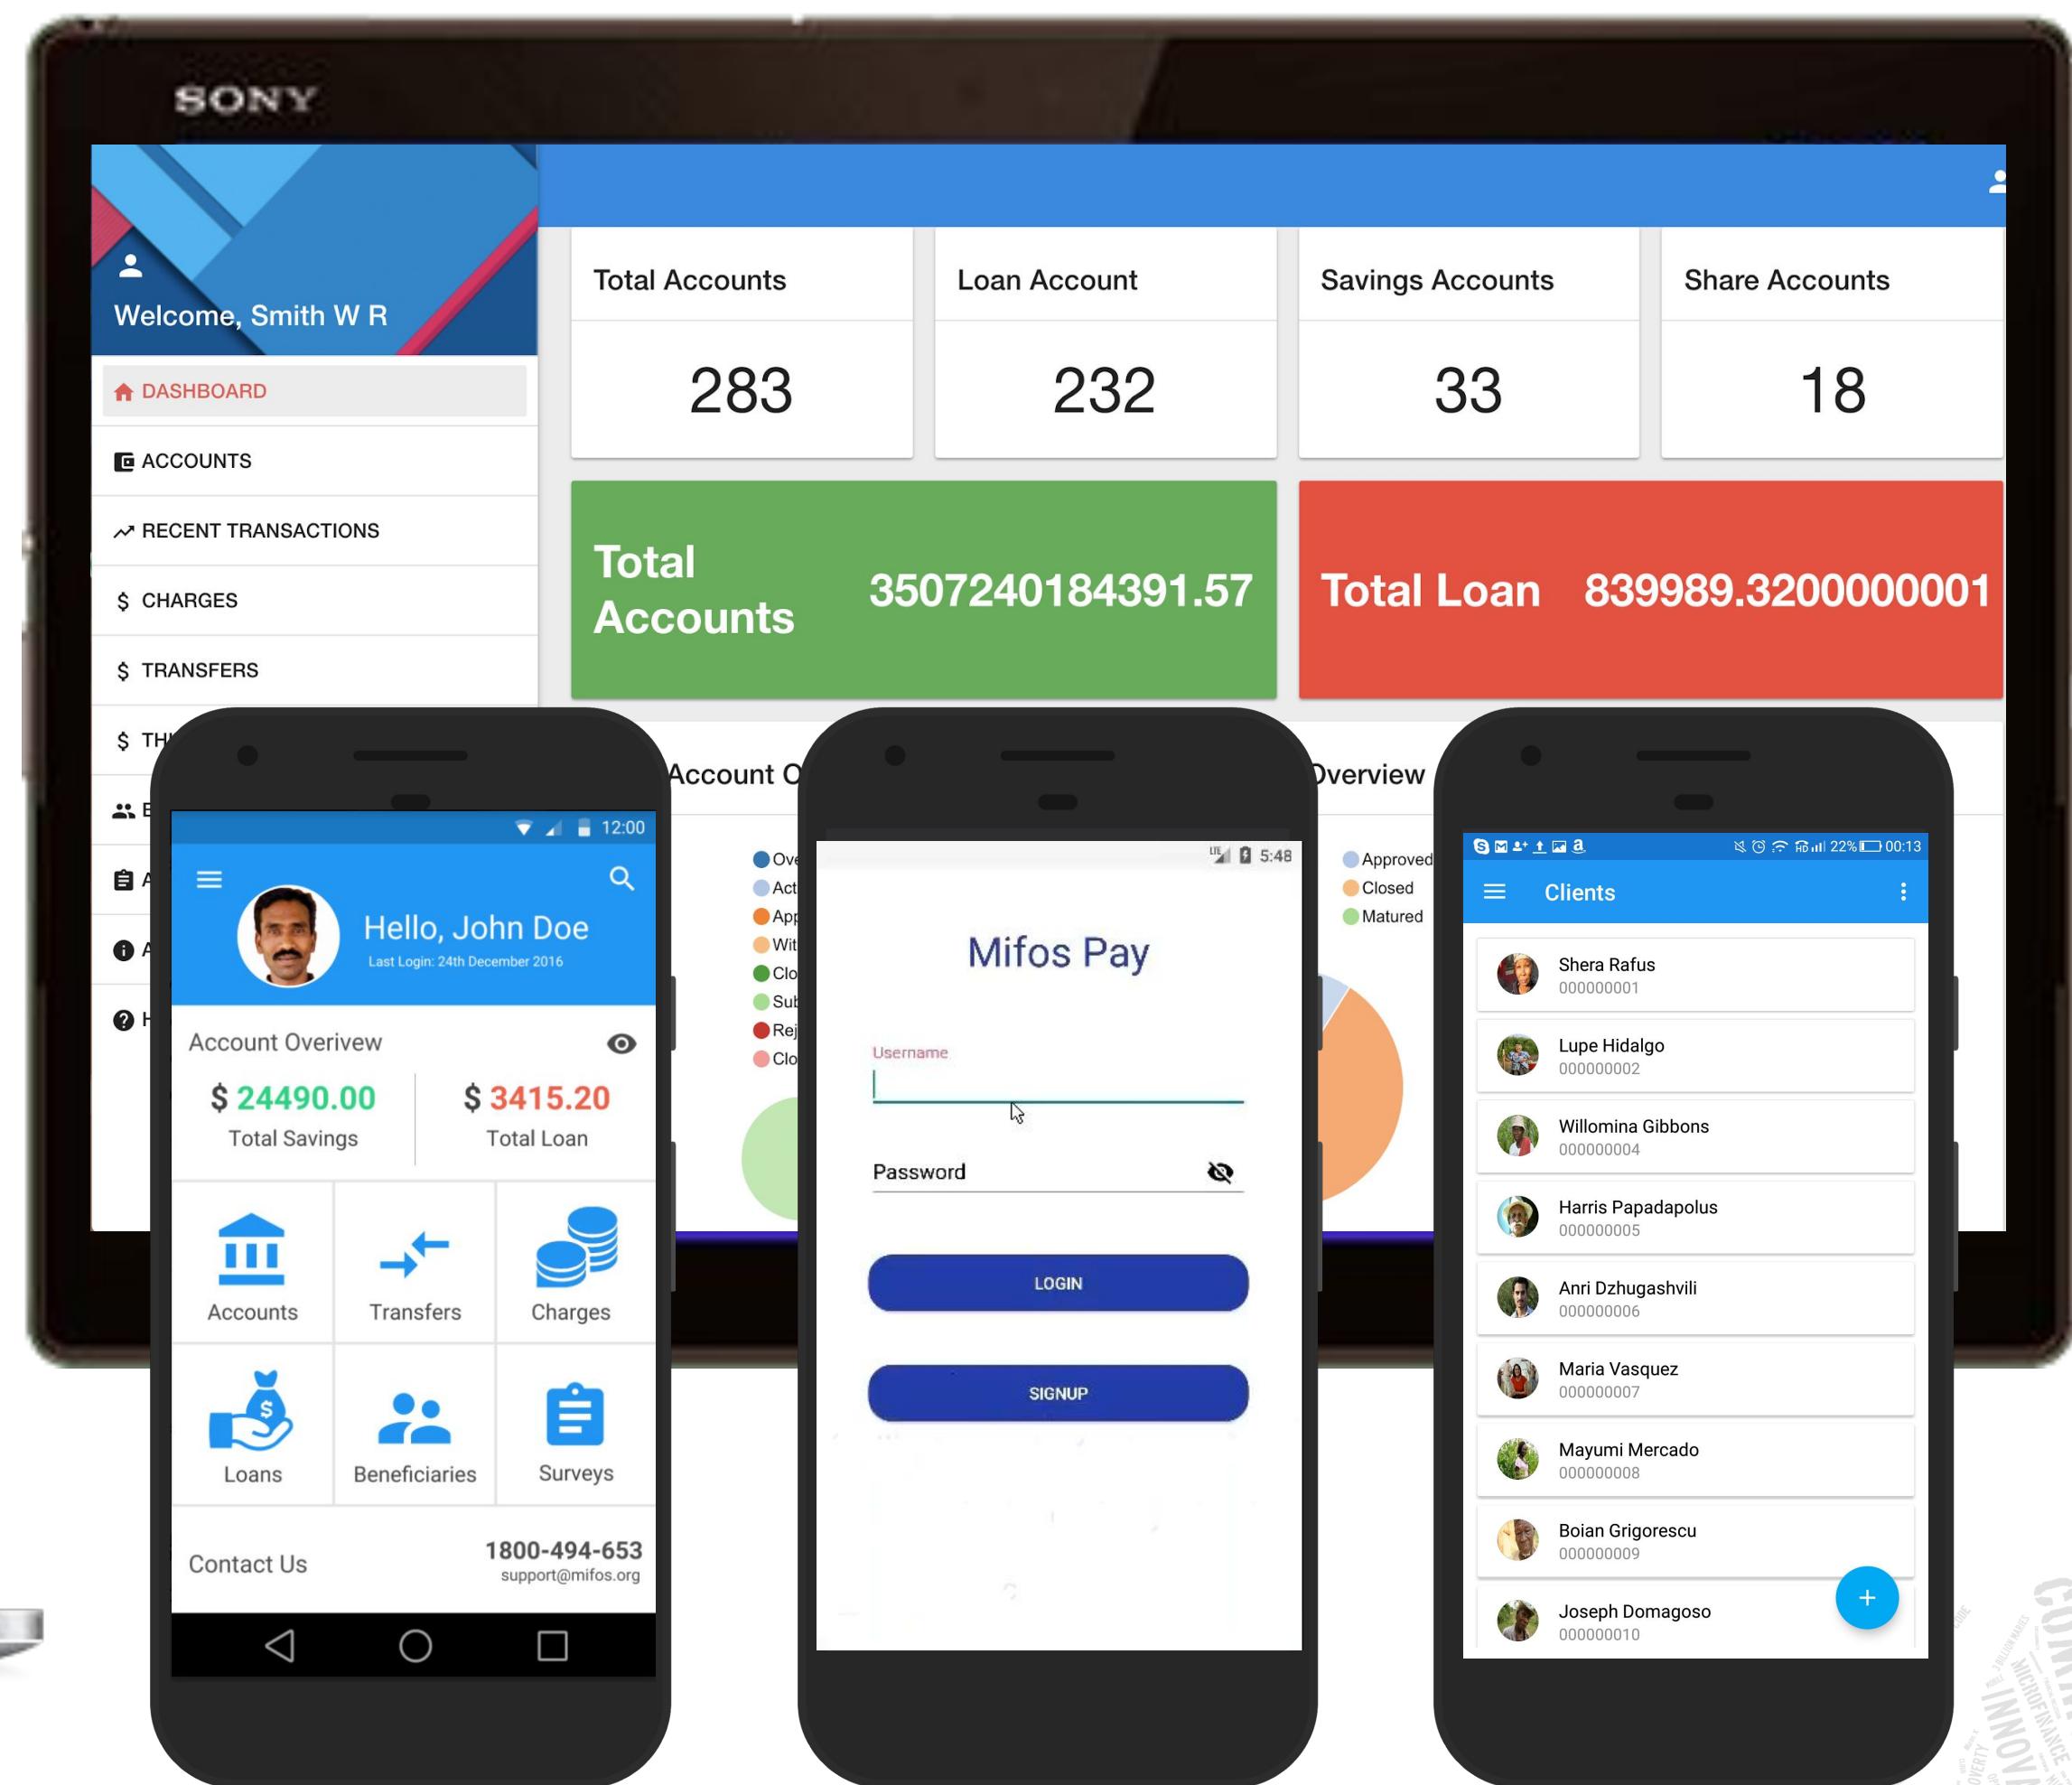

Below the framework, two screenshots of the Mifos web application are displayed. The top screenshot shows a client profile for "Faith White" with tabs for General, Identities, Documents, Additional details, Bank Account Details, Client Family, Customer Status, Family Details, and Proxy Example. It includes buttons for Edit, New Loan, New Saving, New Share Account, Add charge, Transfer Client, Close, Unassign Staff, and More. The bottom screenshot shows an Income Generating Loan (#00000067) with tabs for Add Loan Charge, Prepay Loan, Assign Loan Officer, Foreclosure, Make Repayment, Undo Disbursal, and More. It displays loan details such as Disbursement Date (01 January 2017), Loan Purpose (Not Provided), Loan Officer (Unassigned), Currency (US Dollar(USD)), External Id (Not Provided), Proposed Amount (10,000), Approved Amount (10,000), and Disburse Amount (10,000). It also shows performance history with 25 repayments.

Application Framework

@mifos

## Online Banking App

The Online Banking App is shown running on a Sony Xperia smartphone. The screen displays a dashboard with the following information:

- Total Accounts: 283
- Loan Account: 232
- Savings Accounts: 33
- Share Accounts: 18
- Total Accounts: 3507240184391.57
- Total Loan: 839989.3200000001

The app also shows a recent transactions section, a charges section, and a transfers section. Below the dashboard, there are sections for Account Overview, Mifos Pay (with login and sign-up buttons), and Clients (listing users like Shera Rafus, Lupe Hidalgo, etc.).

# Ecosystem - Fintech powered by Mifos and Fineract

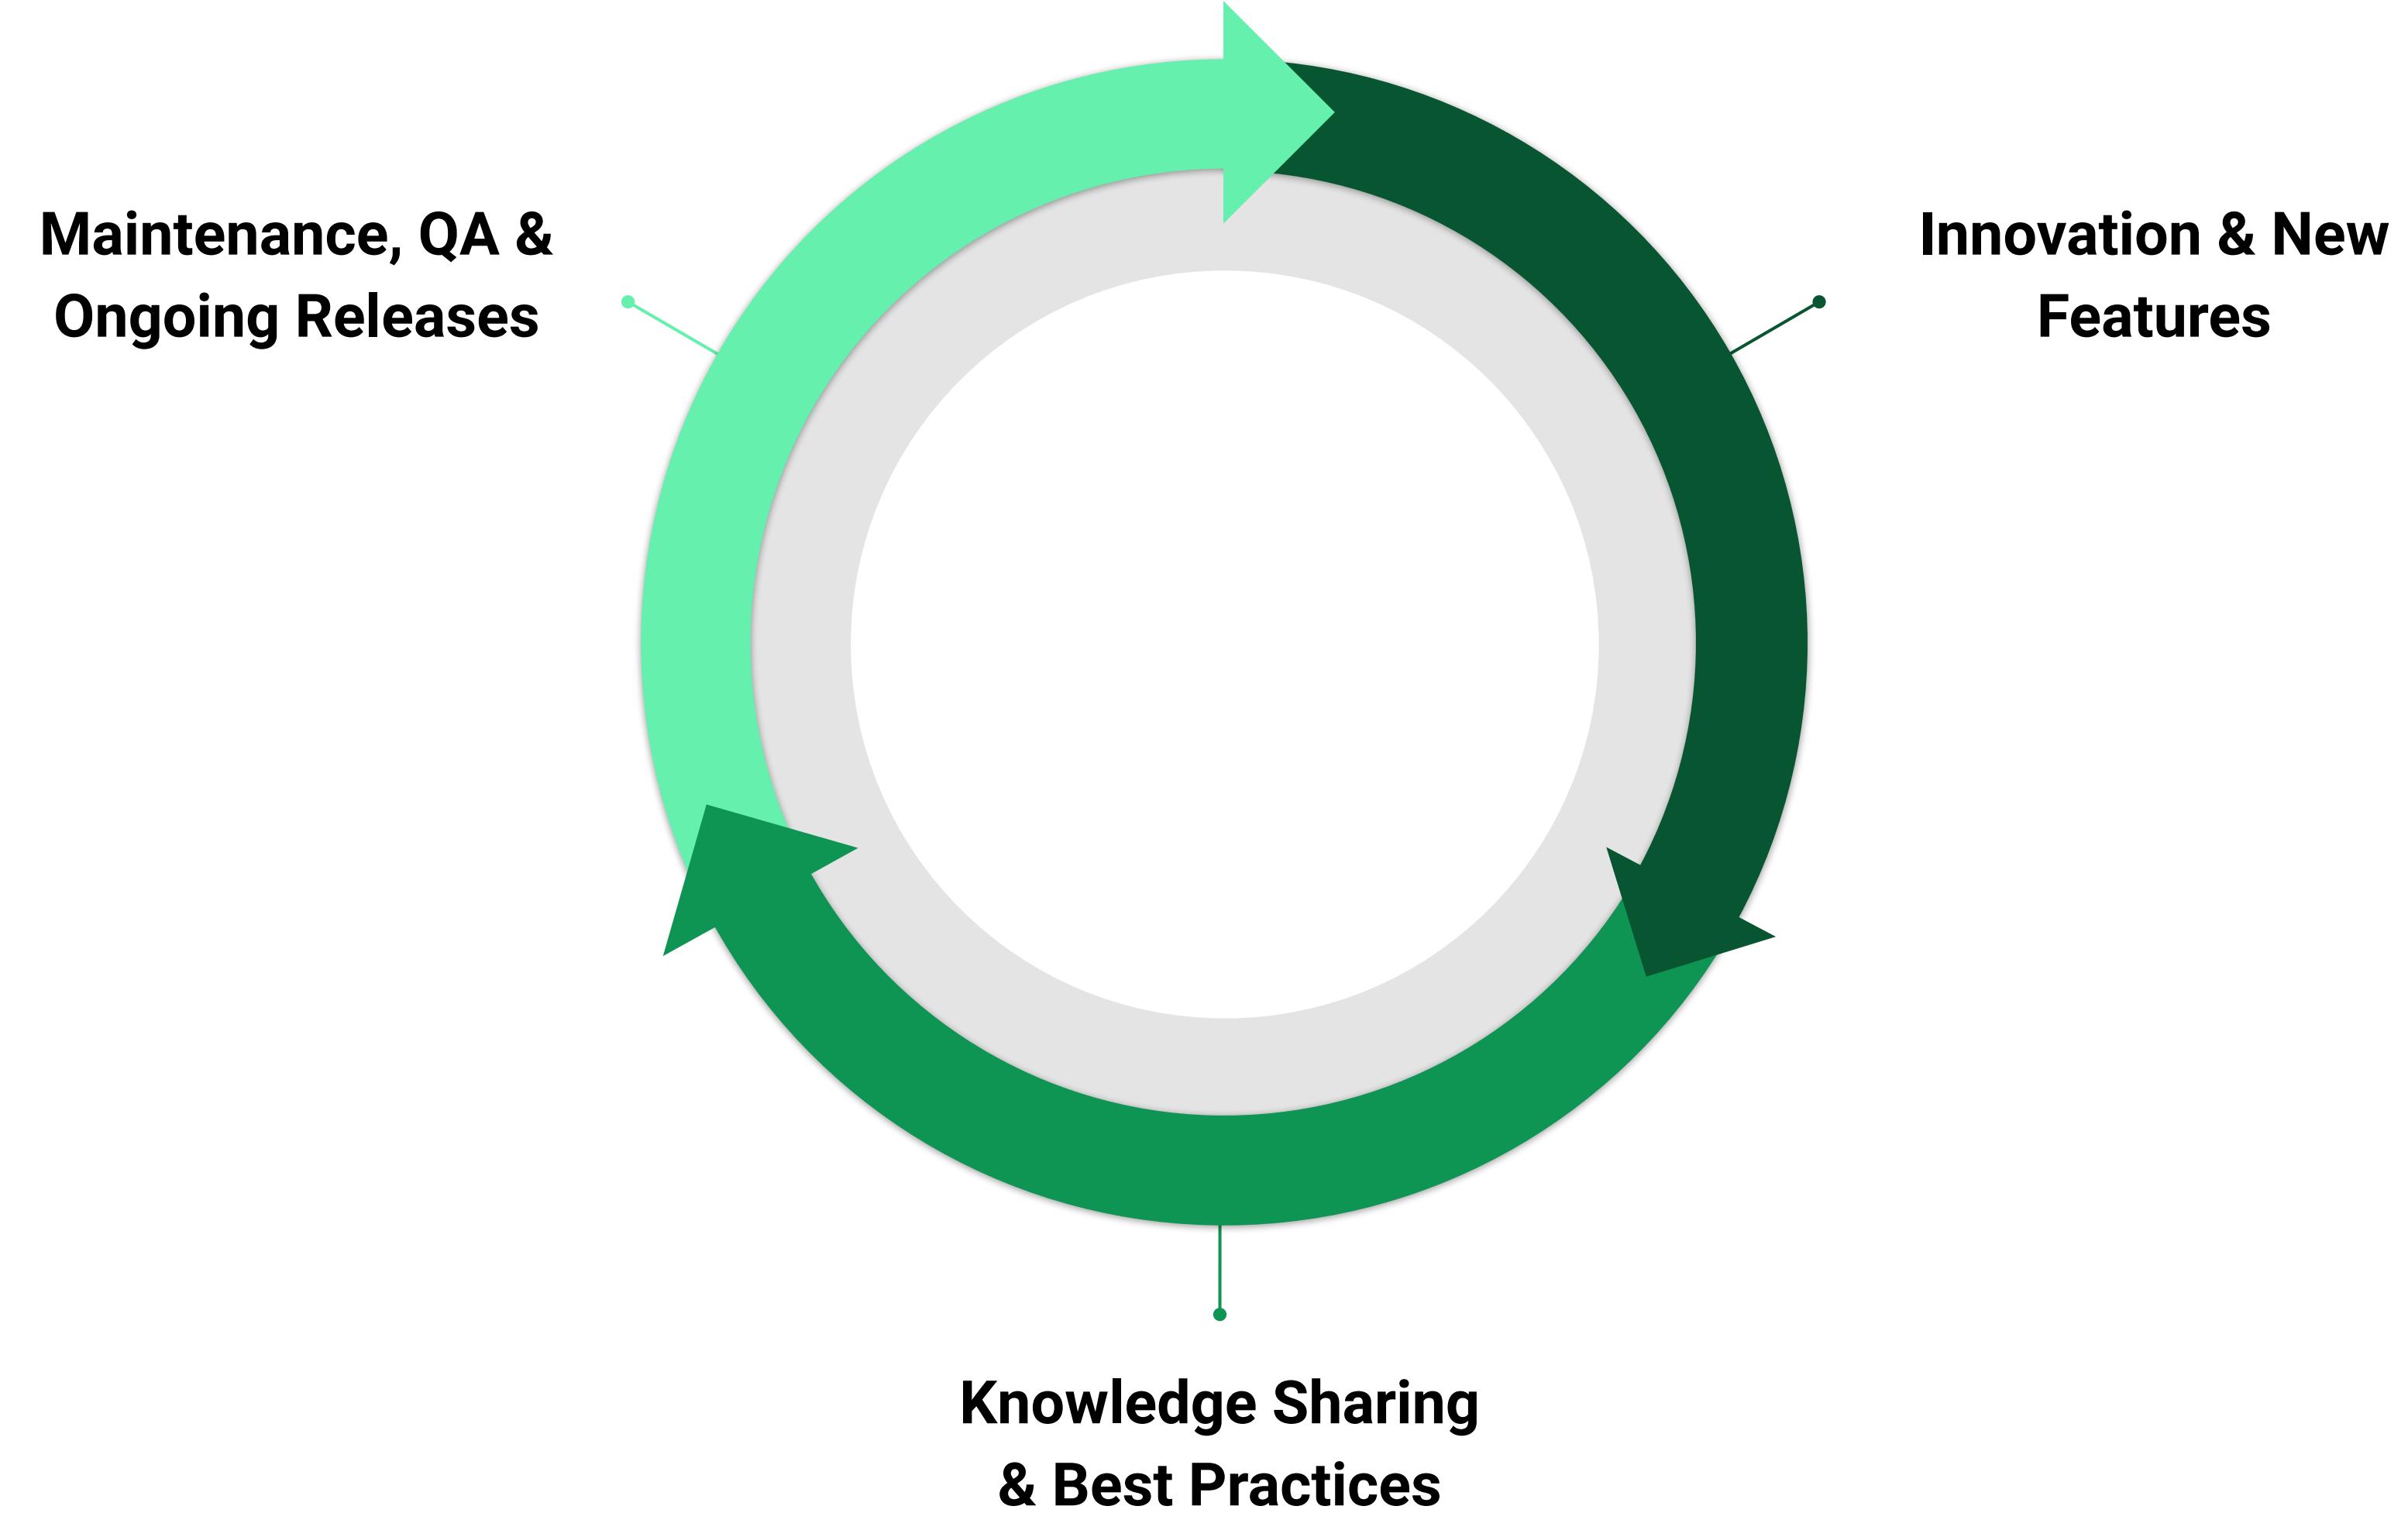

**FINTECHEANDO** 

**dpc**  
consulting

**fiter**

**Fynarfin** 

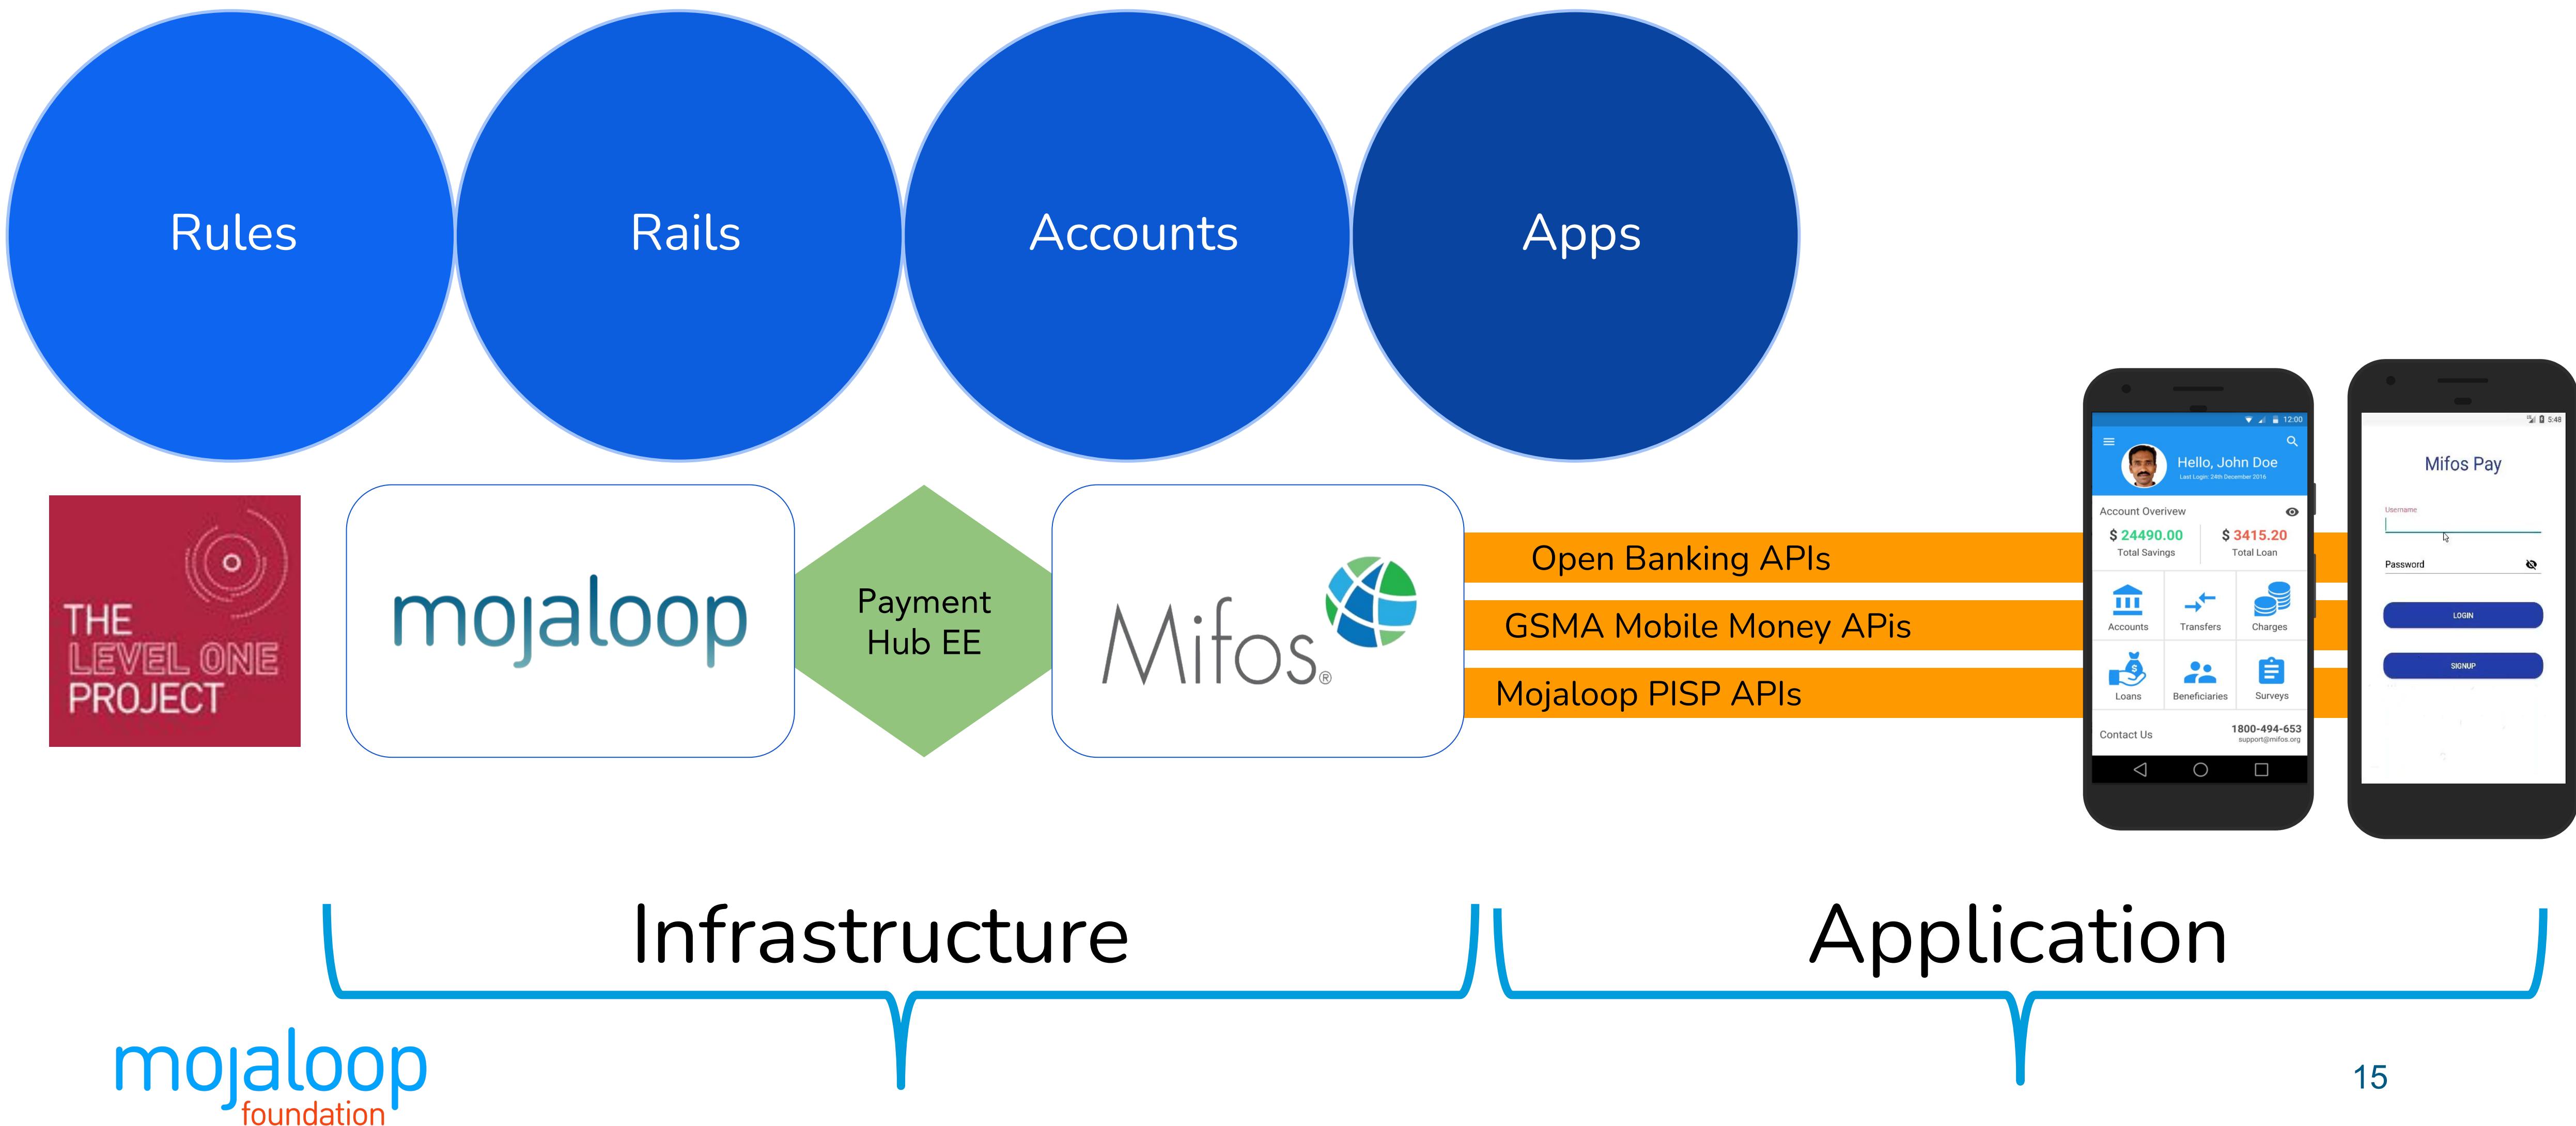

# Enabling a Virtuous Cycle

*“You get what you pay for, everyone gets what you pay for,  
and you get what everyone pays for.”*

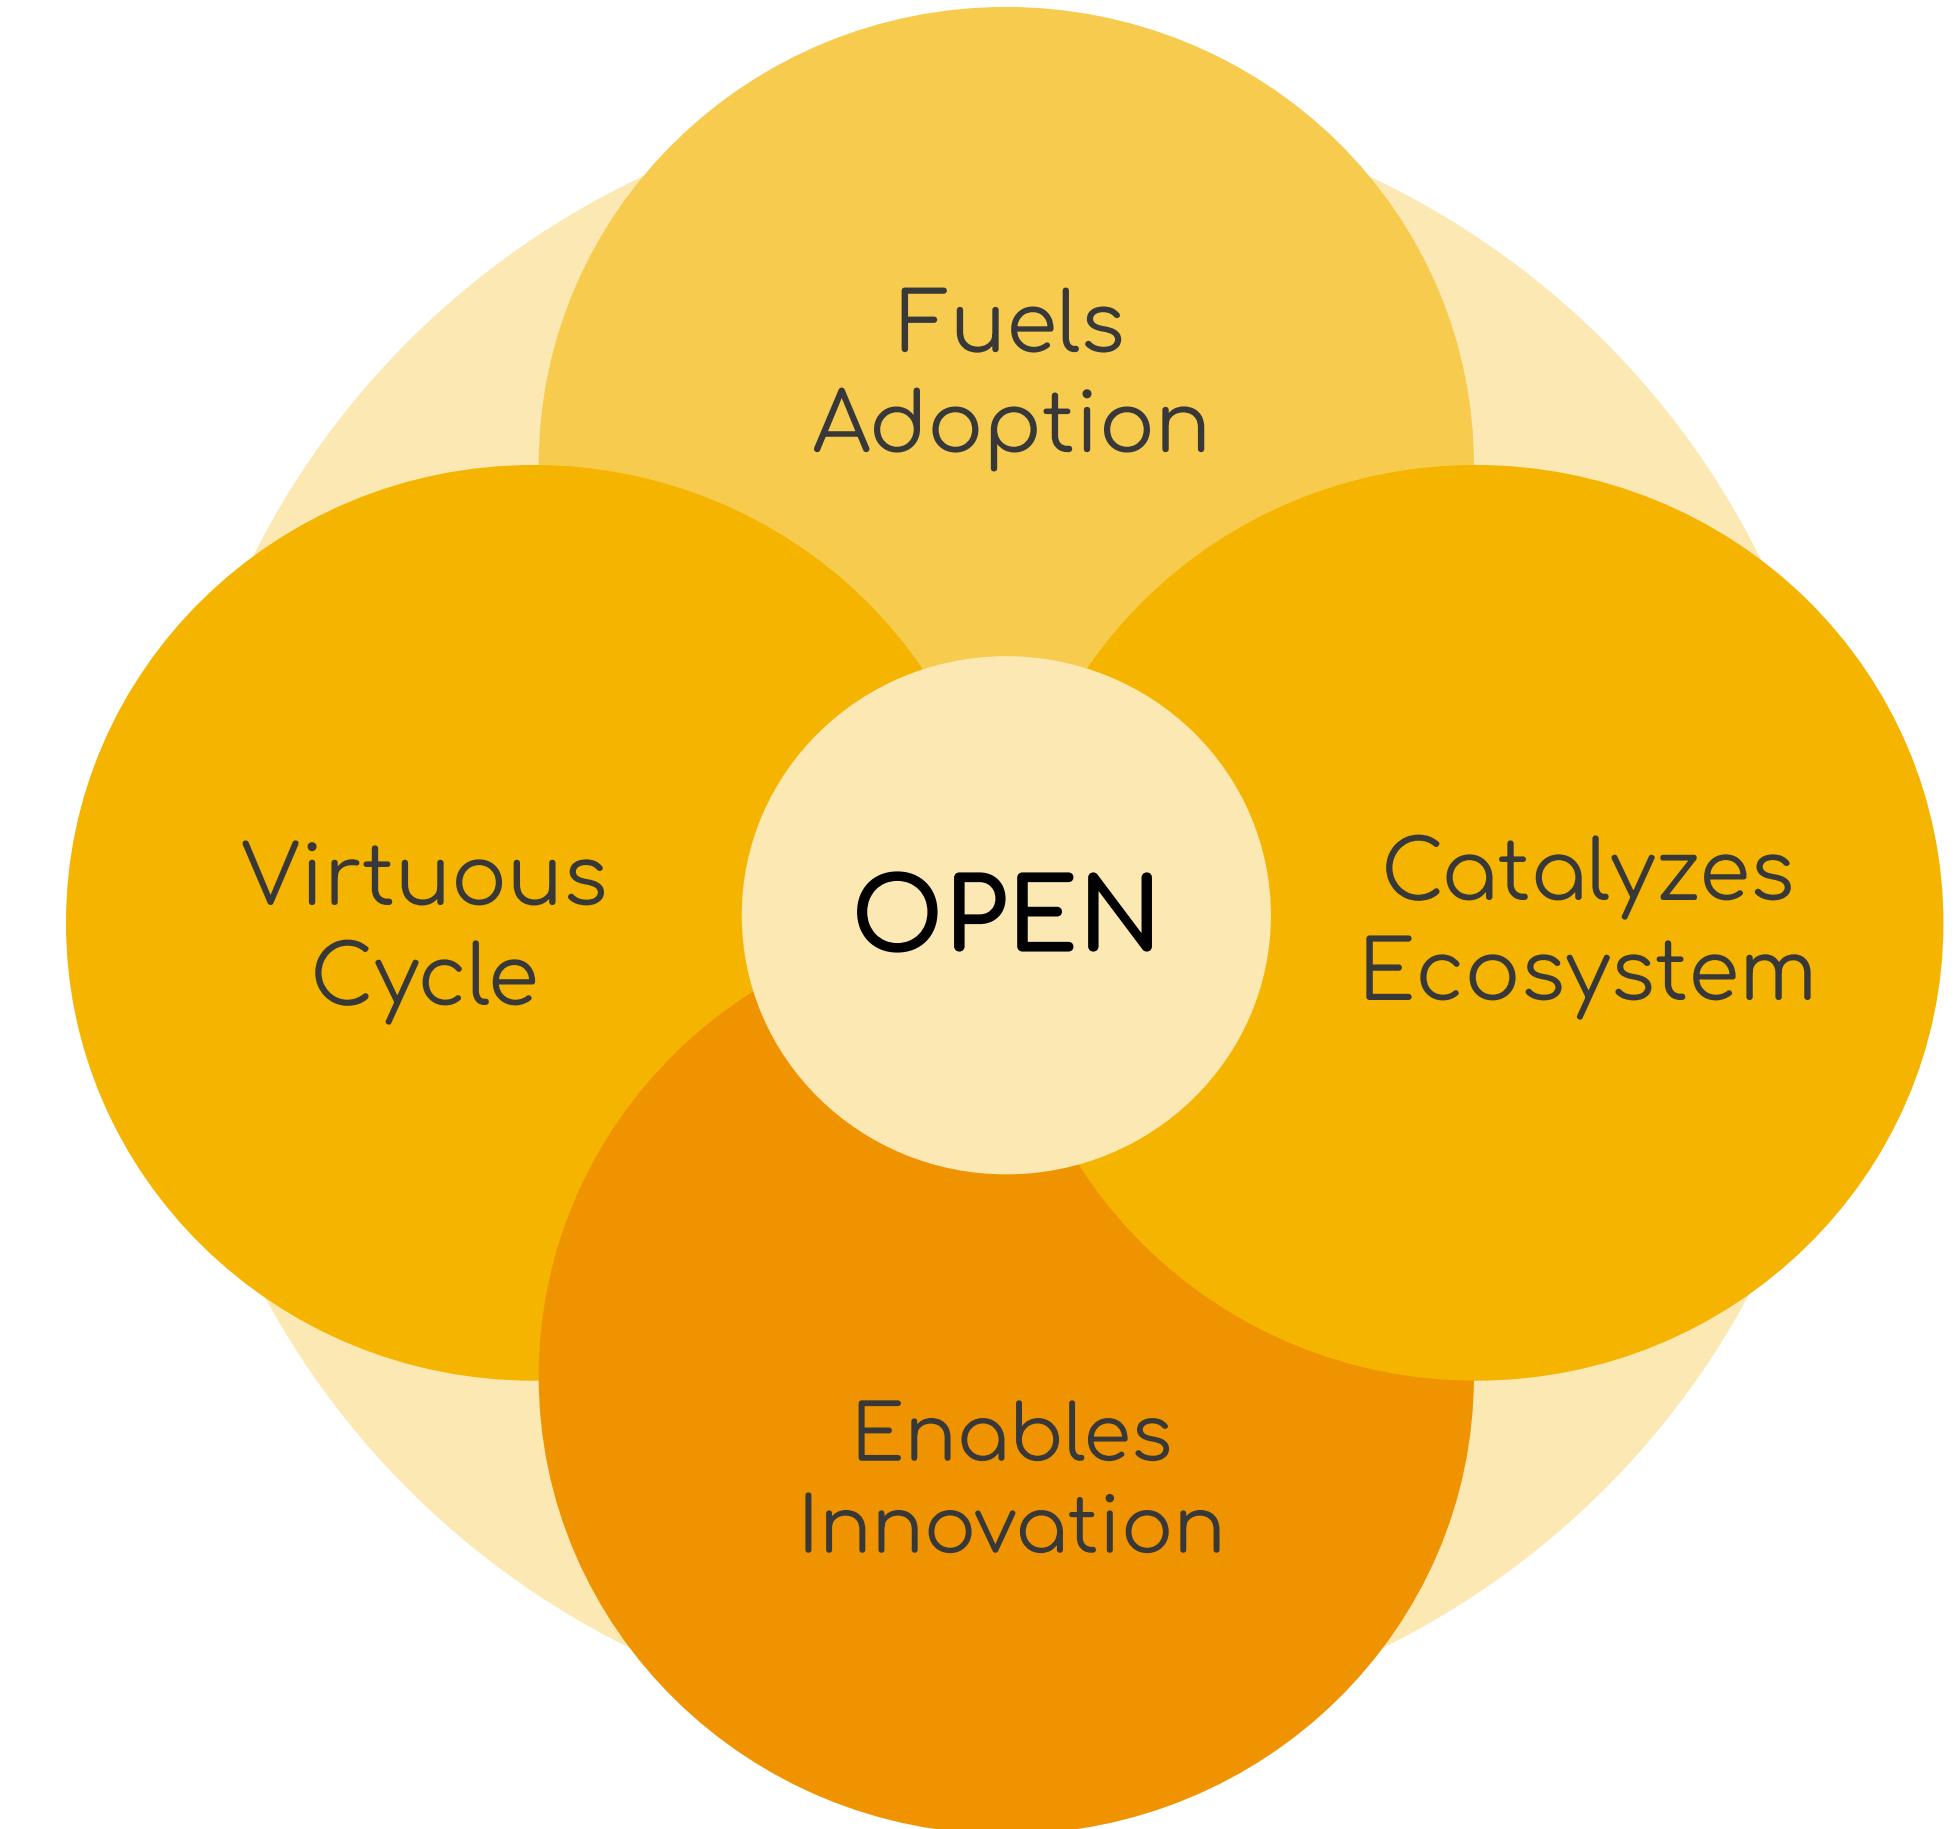

*Paul Ramsey*

# Four Layers of APIs at 2 Different Levels

# Why DFSP Business Ops should be Open

- ❑ Lower Total Cost of Ownership
- ❑ Accelerated Development
- ❑ Focus On Differentiation & Value-Add
- ❑ Freedom from Vendor Lock-In
- ❑ Sustainable Business Models

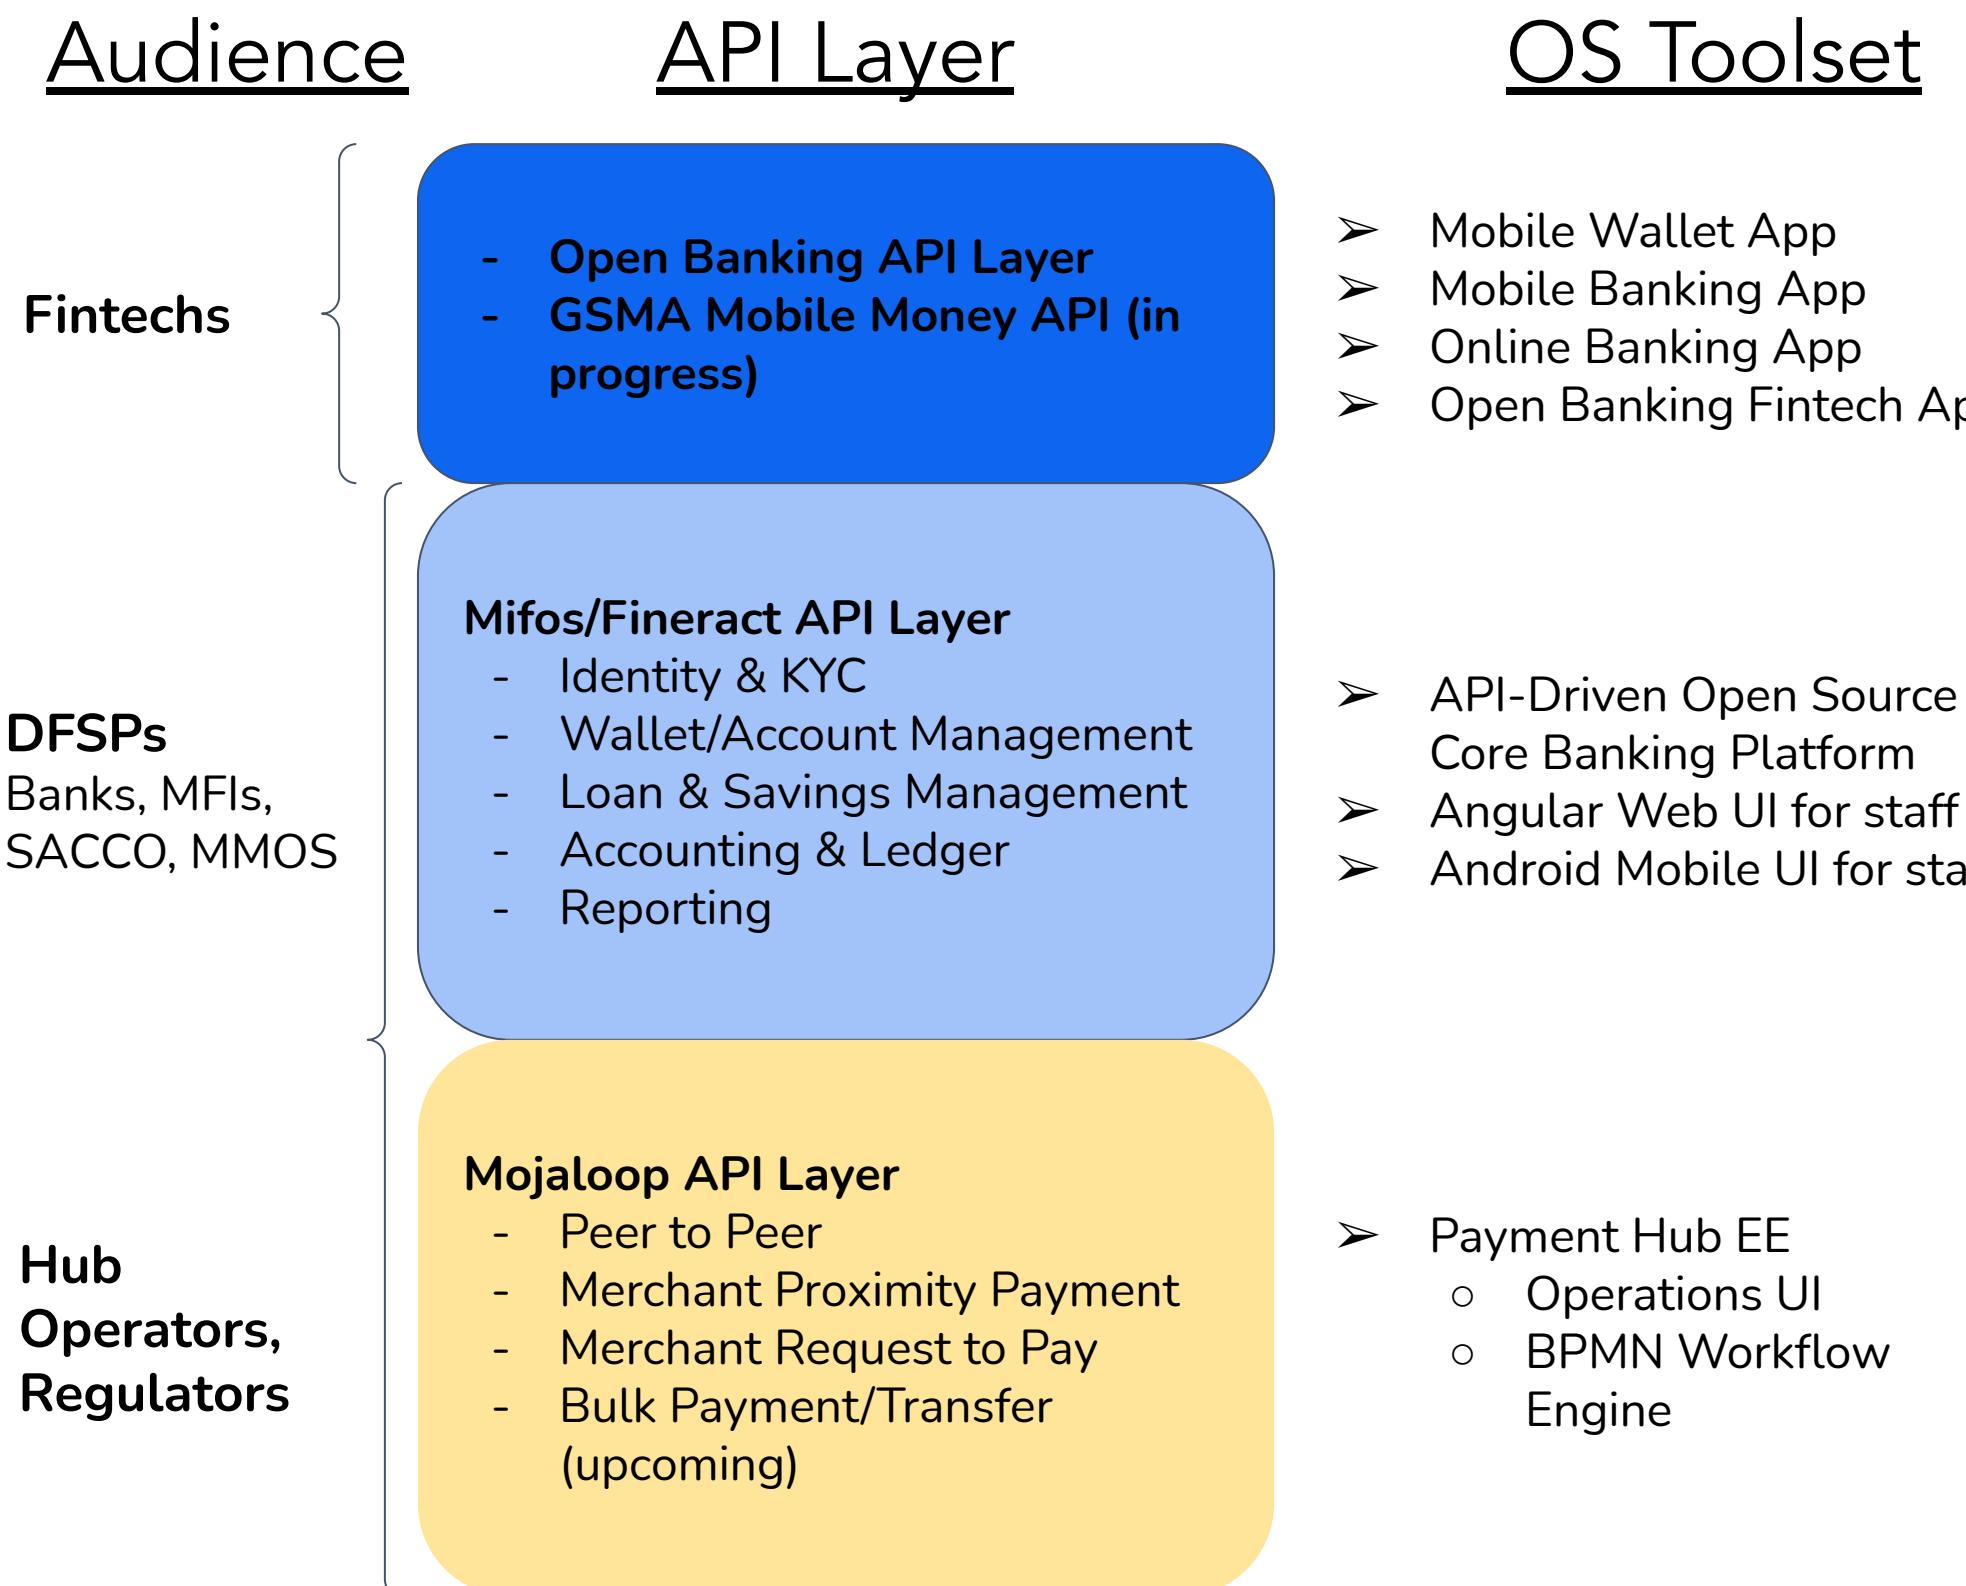

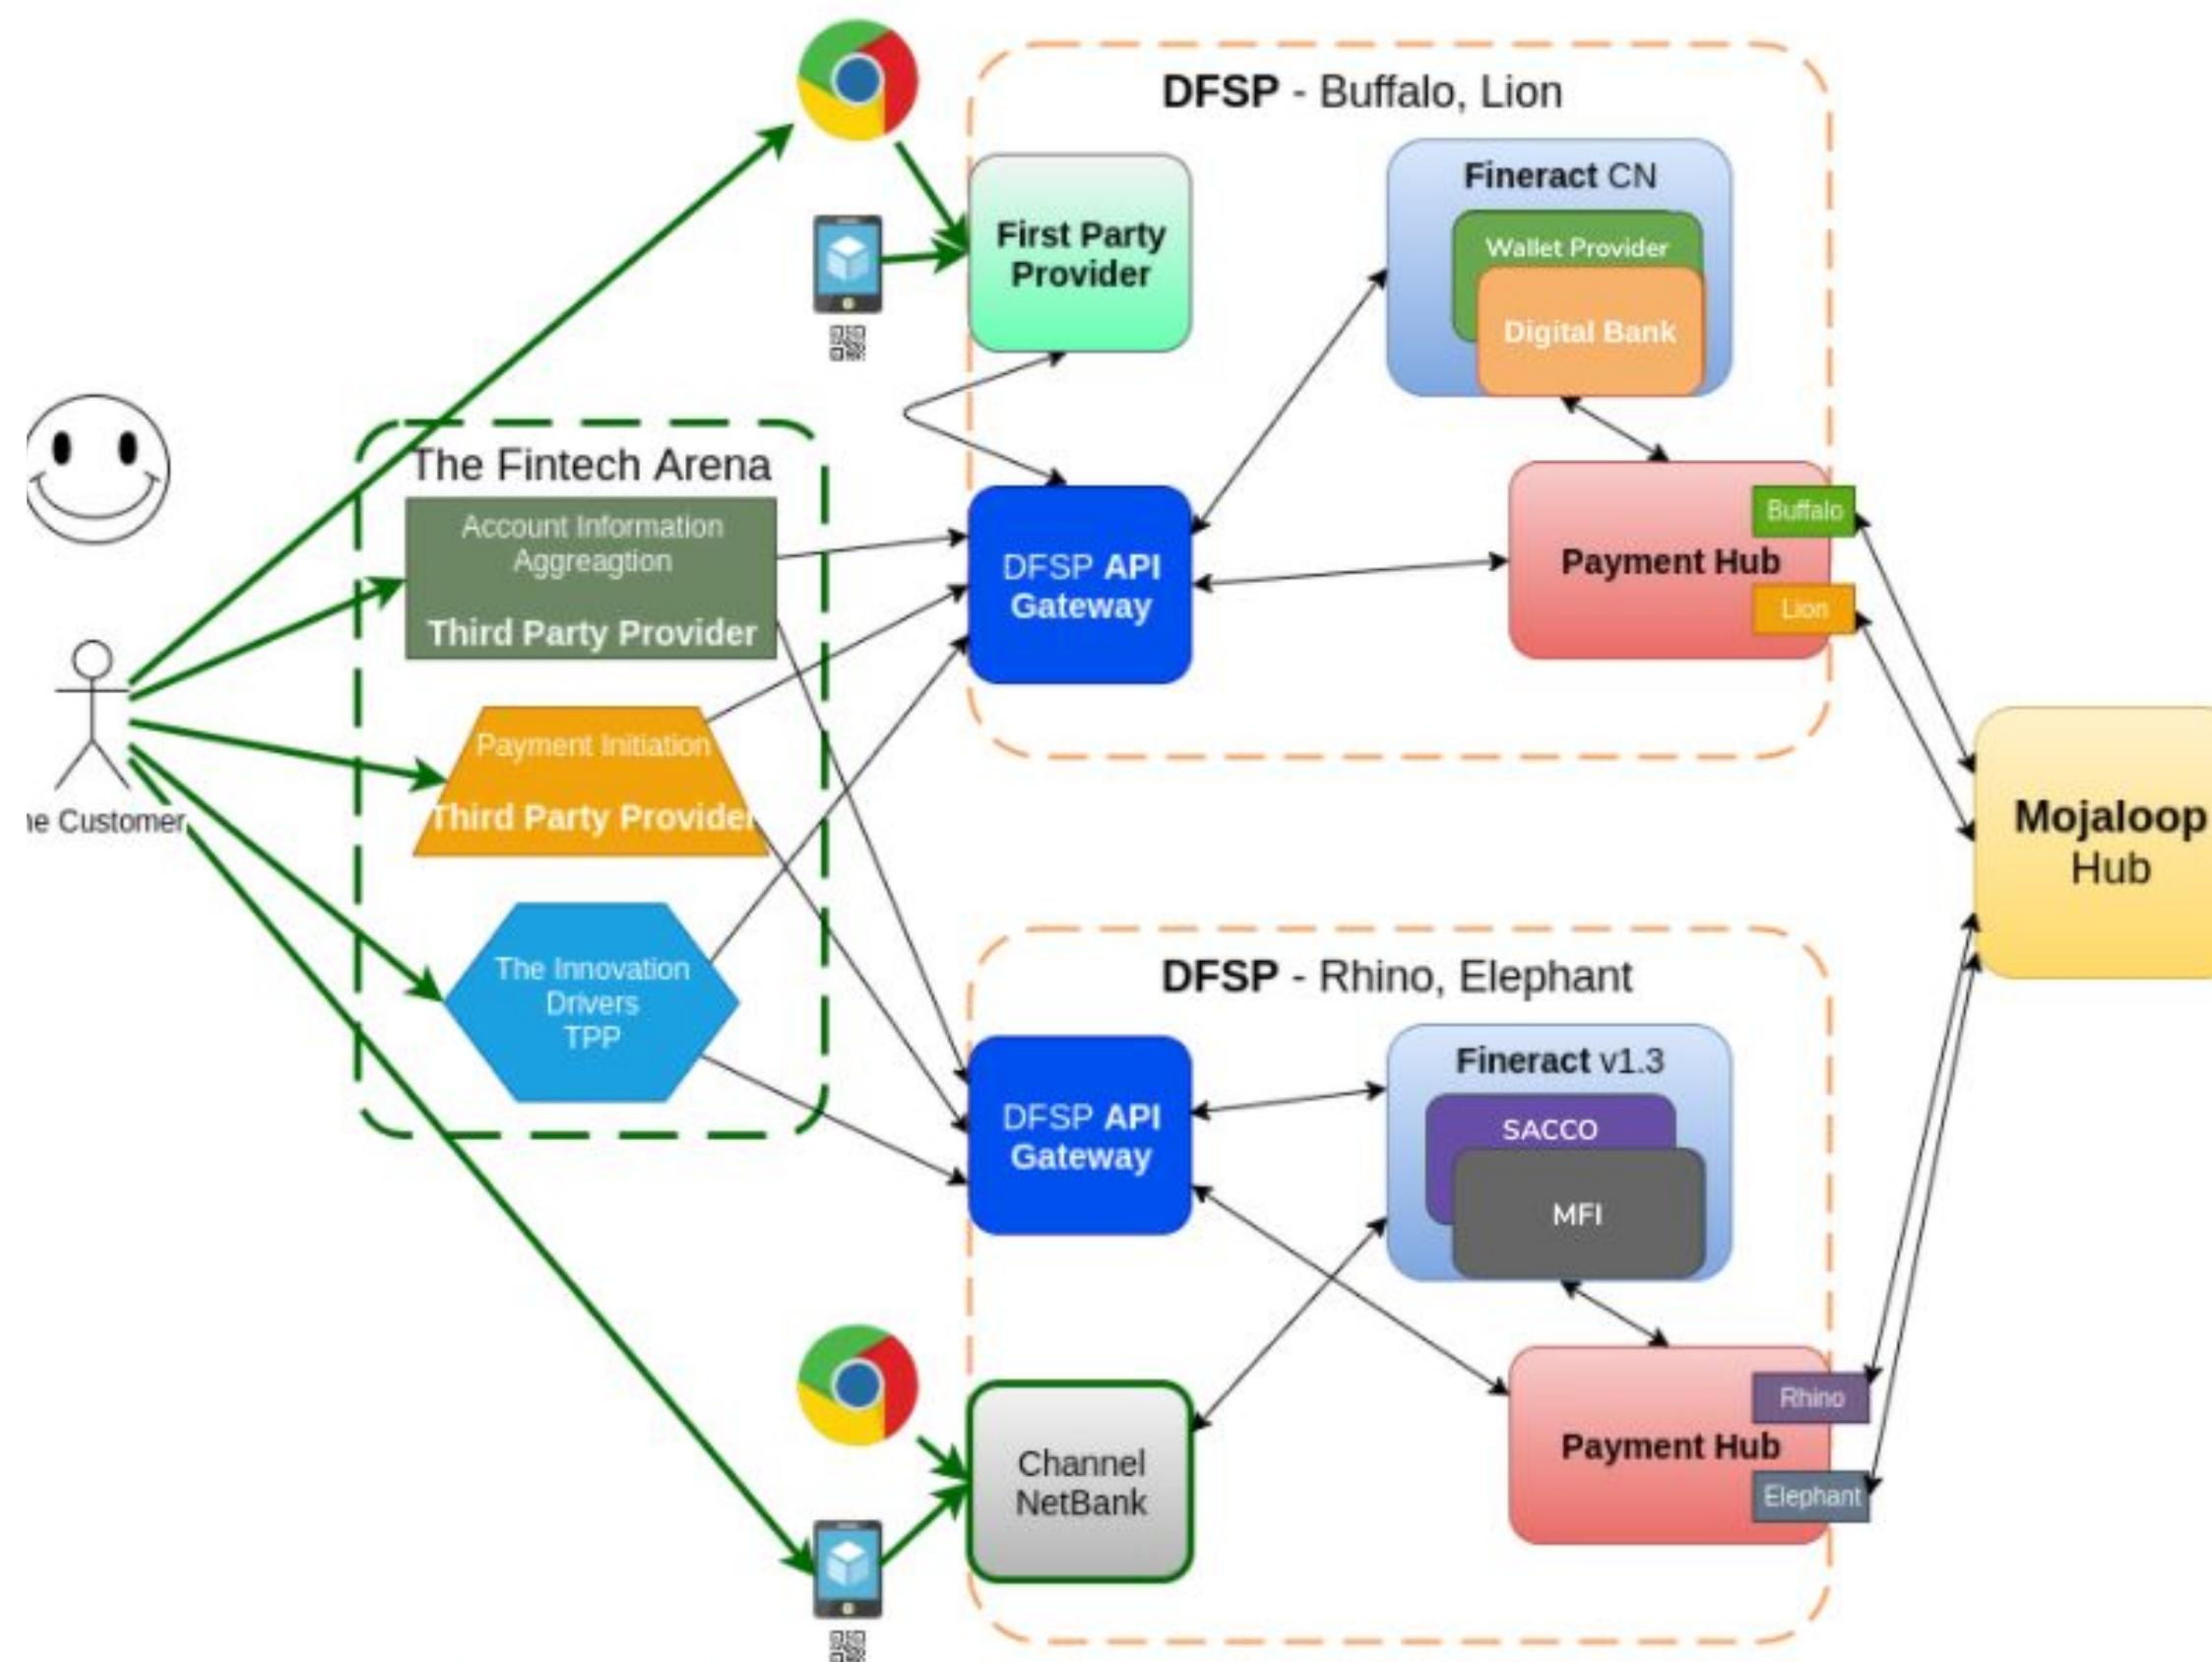

# Go Farther Together

- ❑ Better collaboration at a strategic level between Mifos & Mojaloop Communities
- ❑ Leverage our collective assets to drive deployments
  - ❑ Work towards reference deployments of our digital public goods
  - ❑ Be leaders in G2P innovation
  - ❑ Provide open source tooling for regulatory sandboxes
- ❑ Address common challenges at a community and ecosystem level
  - ❑ Defining boundaries of the open core and stimulating a marketplace
  - ❑ Establishing a functional upstream contribution model from vendors on the project
  - ❑ Changing the narrative & procurement process around OS amongst governments
  - ❑ Collaborate together with FINOS to build these resources

# Go Farther Together

- ❑ Connect Mifos Lab with central Mojalab Environment
- ❑ Support the Demo Working Group
- ❑ Synergize with and leverage other community efforts
- ❑ Make DFSP Operations Open
- ❑ Accelerate Existing Projects

# Connect the Mifos Lab with the Mojaloop

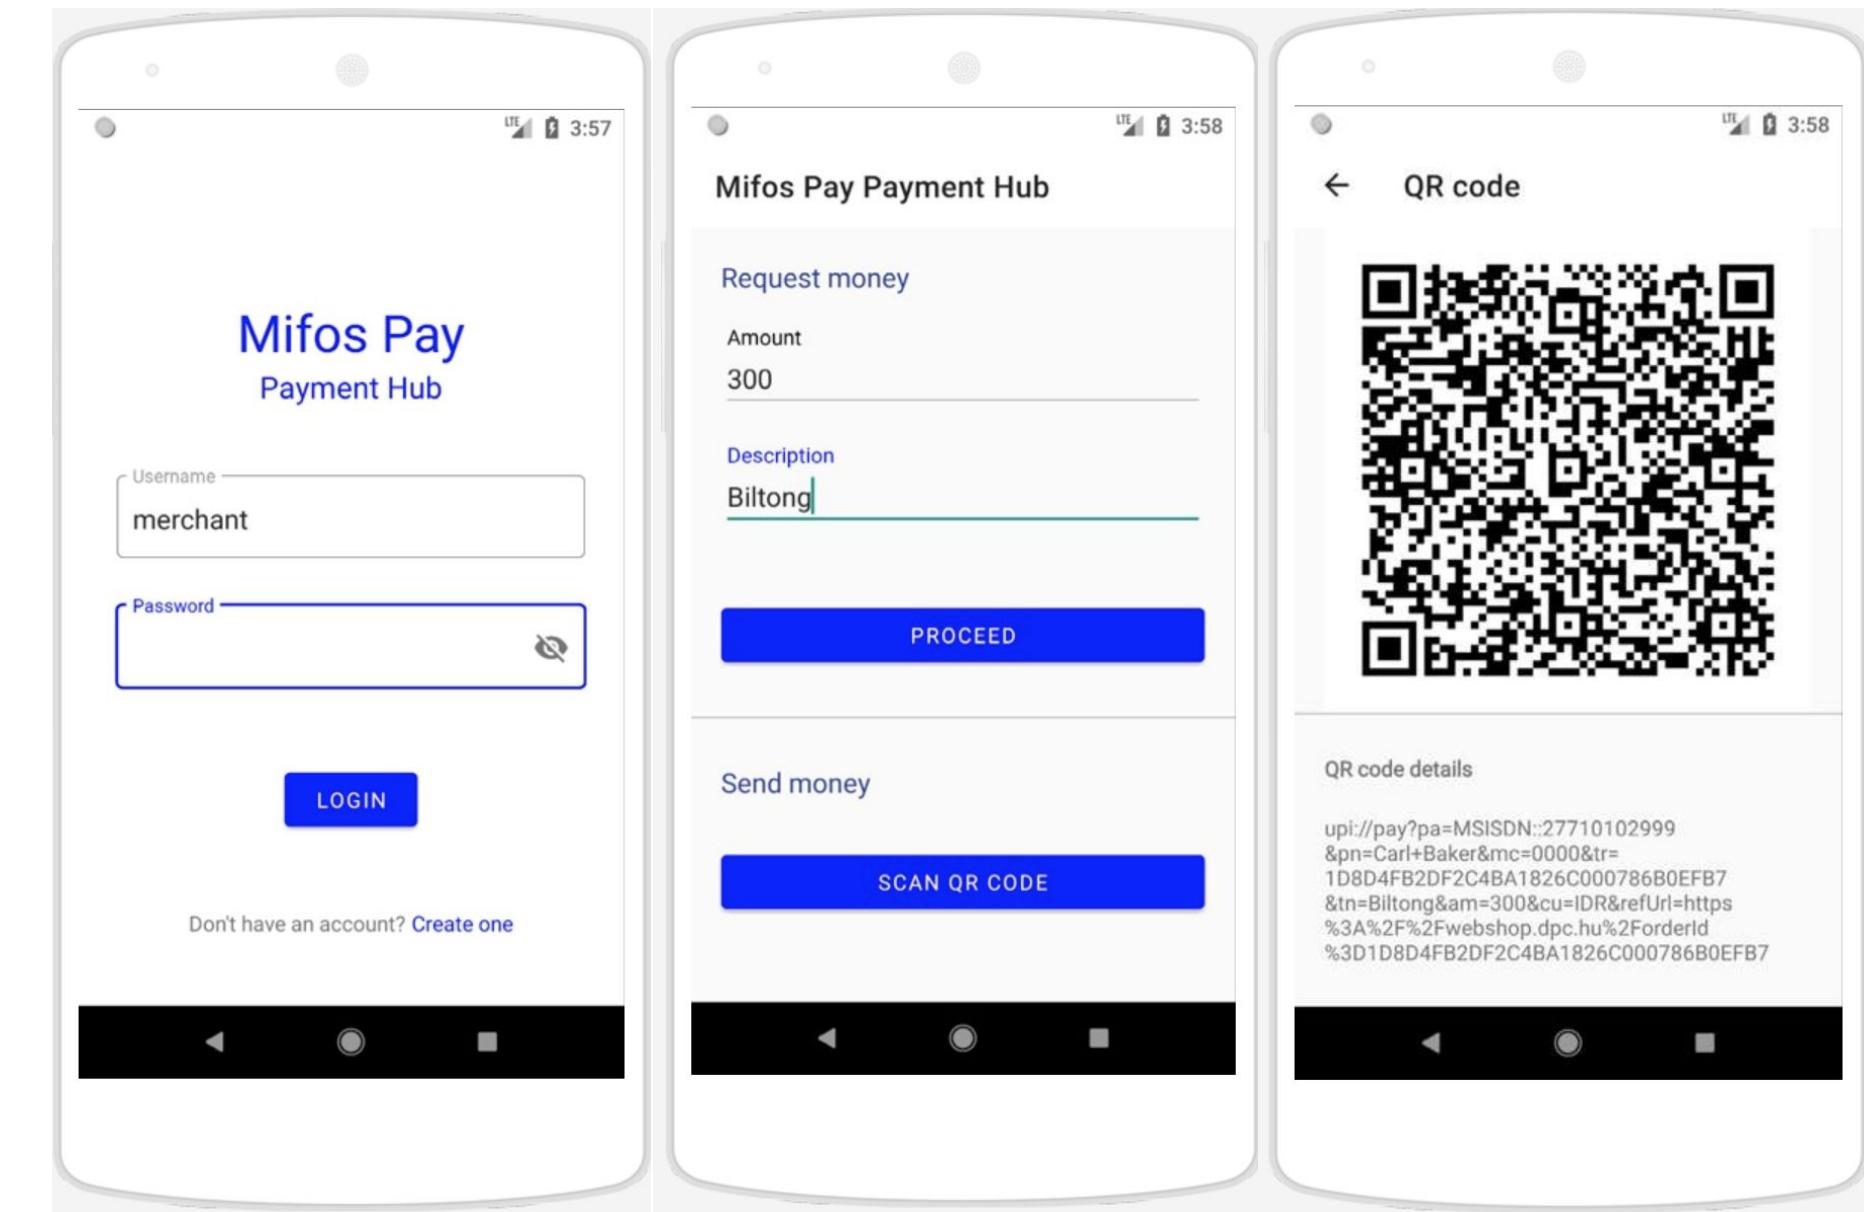

- ❑ Provide reference DFSP UIs
- ❑ Provide reference customer apps - mobile wallet, PISP/fintech app
- ❑ Connect Fineract-based systems like Musoni via Payment Hub

- ❑ Support future DFS Lab hackathons
- ❑ Collaborate with other DPGs like MOSIP & OpenG2P to demonstrate G2P Use Cases
- ❑ Provide open source tooling for regulatory sandbox efforts

# Support Demo Working Group

## Use Cases

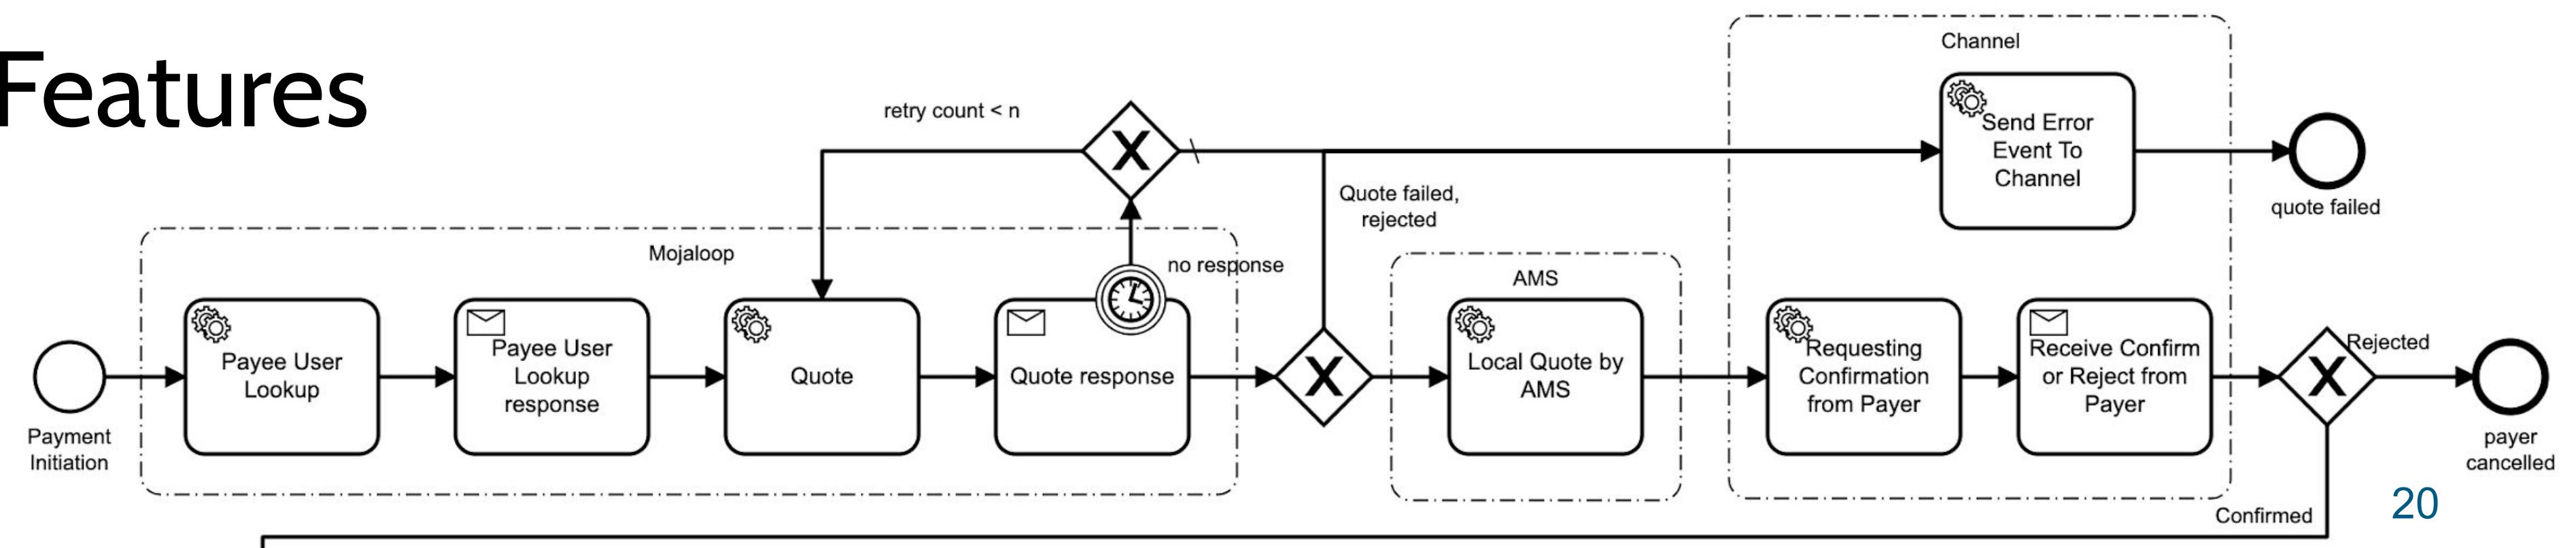

- P2P Transfer
- Fintech-initiated P2P Transfer via Open Banking APIs
- QR Code Payment
- Merchant Request to Pay
- Bulk Payments (future)
- PISP APIs (future)

## Core Mojaloop Features

- ALS
- Quoting

mojaloop  
foundation

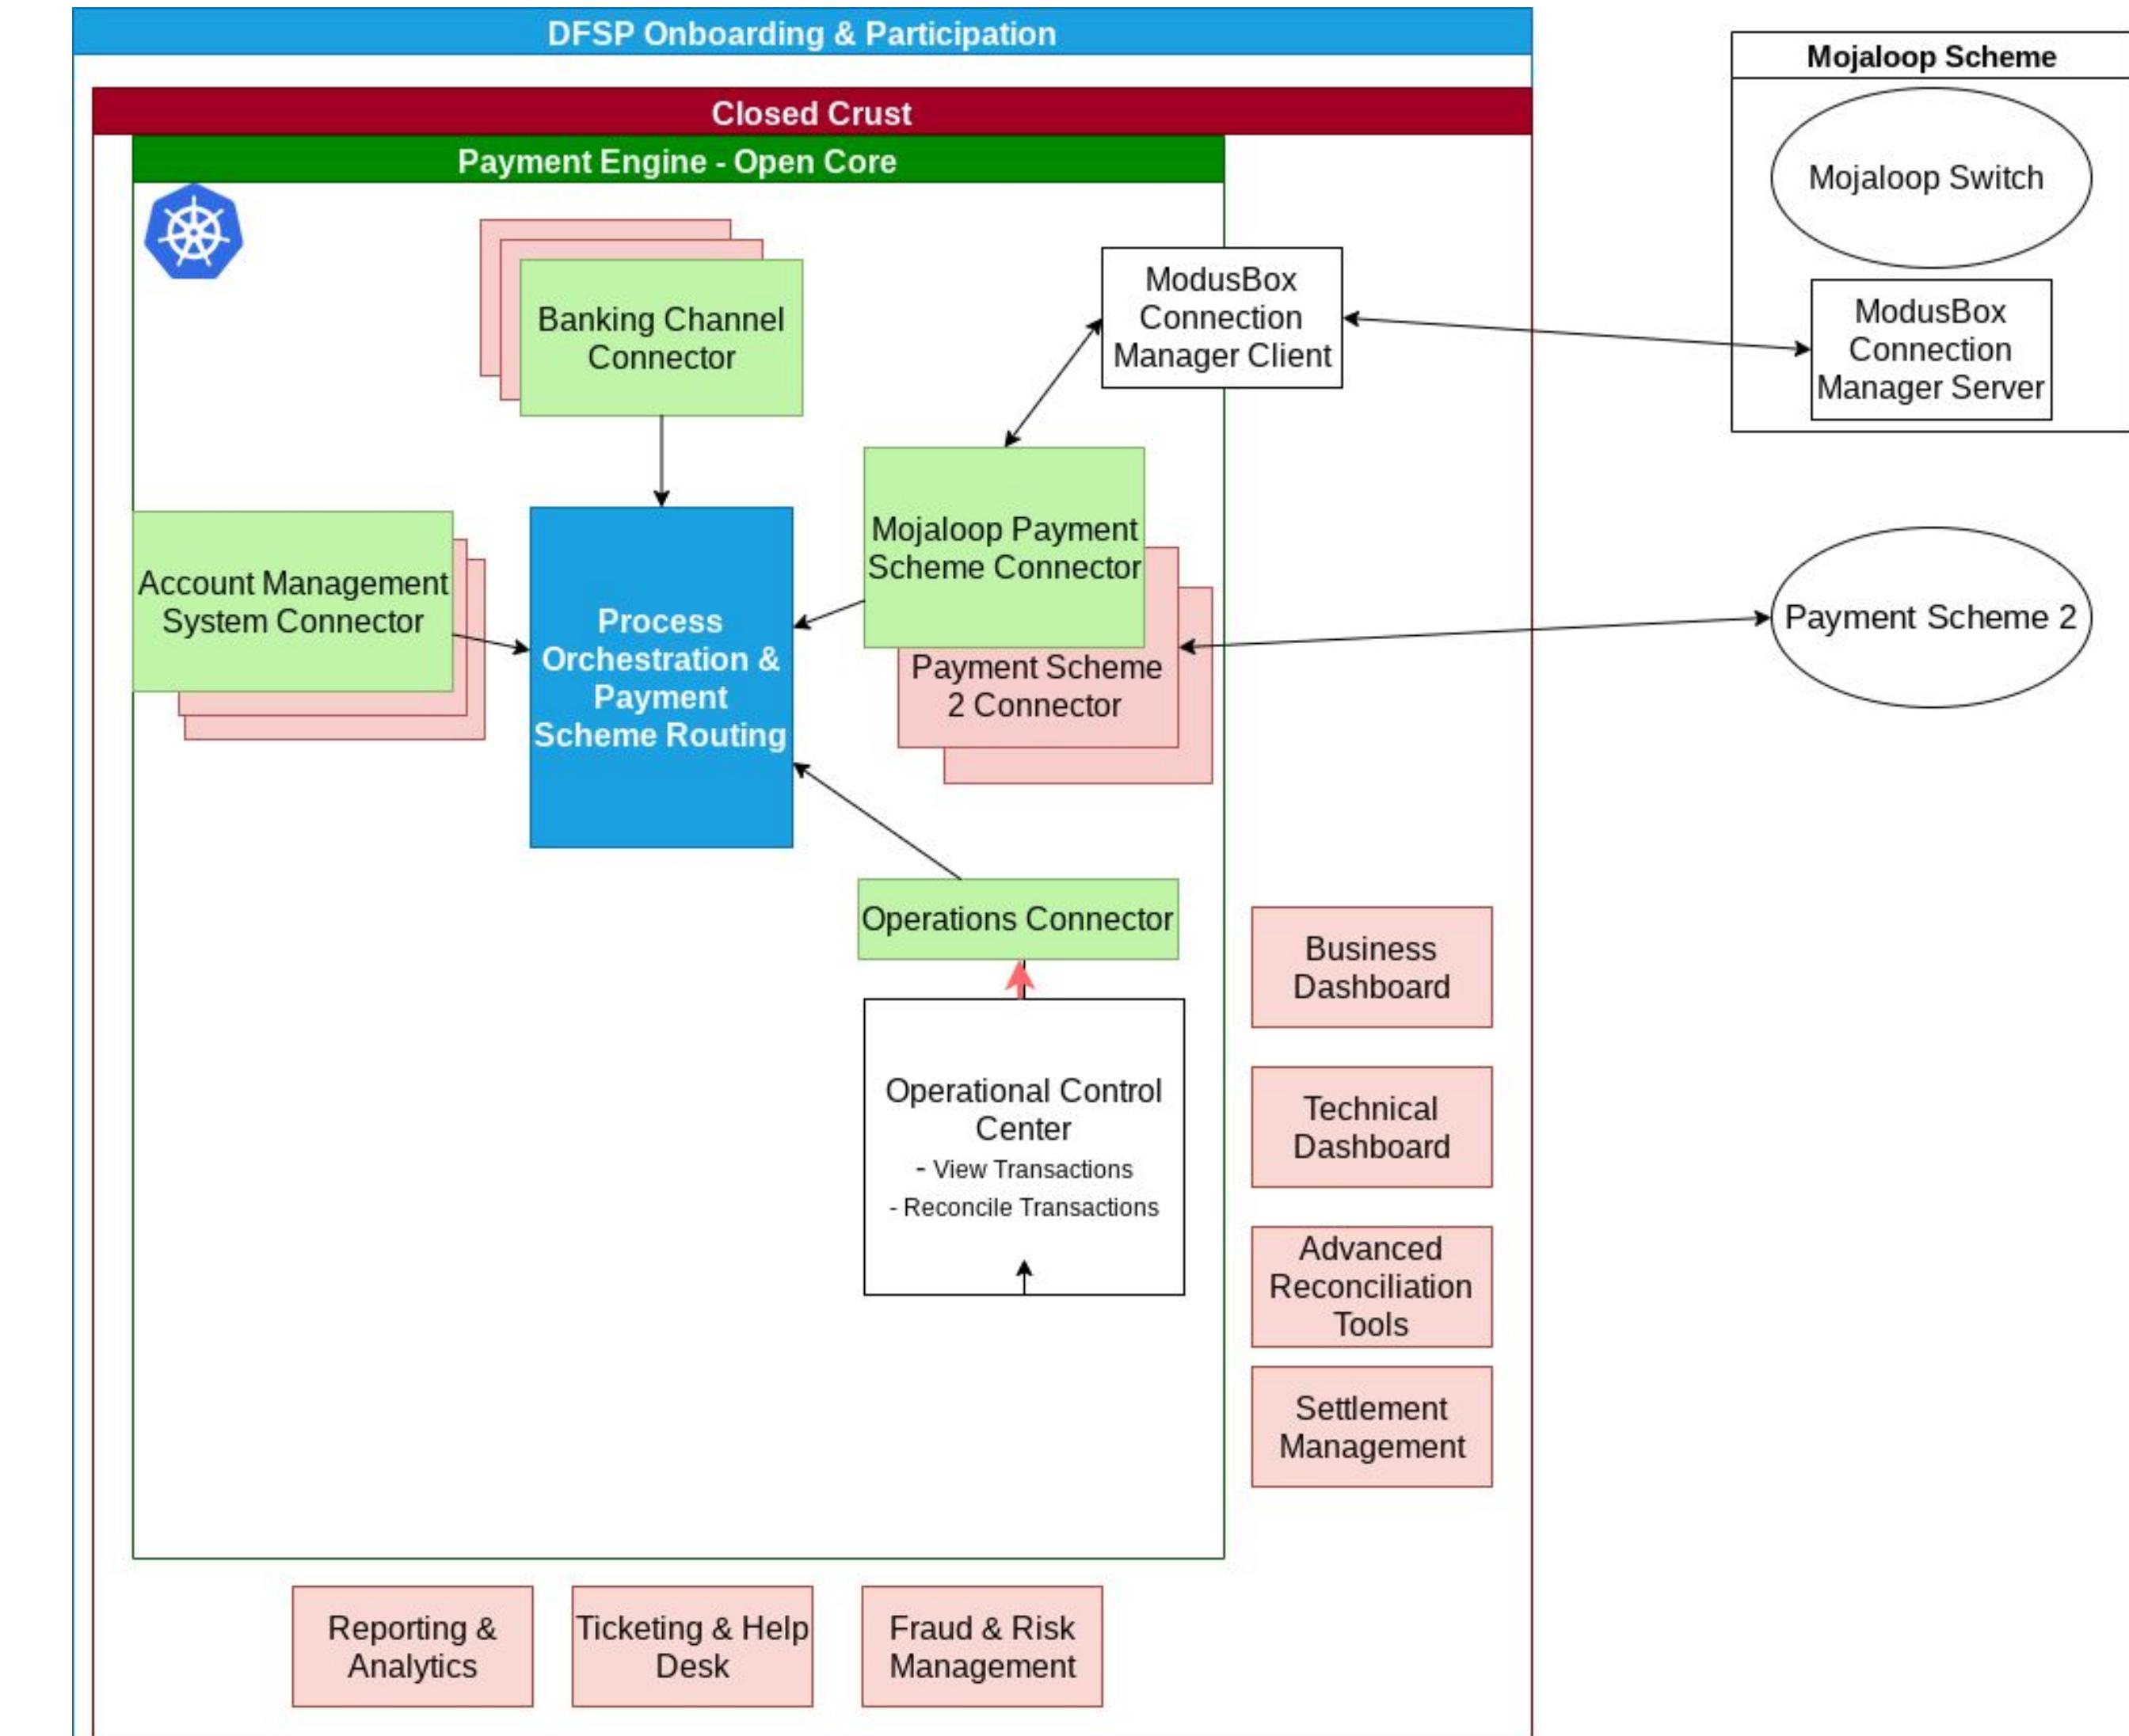

# Synergize with and Leverage other Efforts

- ❑ Incorporate Modusbox Connection Manager
- ❑ Leverage Testing Toolkit as simulator for our lab environment
- ❑ Integrate with GSMA Interoperability Test Lab
  - ❑ Already have GSMA MM API Connector
- ❑ Provide DFSP level testing for FRM service

# Define Open Core for DFSP Operations

- Define common set of processes/requirements
- Establish unified approach for DFSP Onboarding & Participation
- Collaborate around a common OS payment engine architecture
- Collaborative Space vs Competitive Space
  - Define open core and closed crust where innovation and differentiation occurs
- Engage other system integrators to deploy and build out upstream community around open source toolset at DFSP level.
- Only way to sustainably scale to onboard FIs

# Augment UNCDF Efforts in Myanmar & TZ

## Turnkey solution for digitization & digital transformation of MFIs & SACCOs

### Challenge

MFIs lack processes & systems to participate in switch

MFIs lack systems with 24x7 capabilities

MFIs have wide variety of core banking systems and channels

MFIs learn in visual manner

Difficulty connecting dozens or hundreds of MFIs

MFIs need support and training in getting regulated & connected

### Solution

Cloud solution for digitizing and automating core banking operations

Payment Hub EE can provide stand-in processing

Extensible by simply building additional core banking system or channel connectors.

Hands-on lab environment with actionable tools

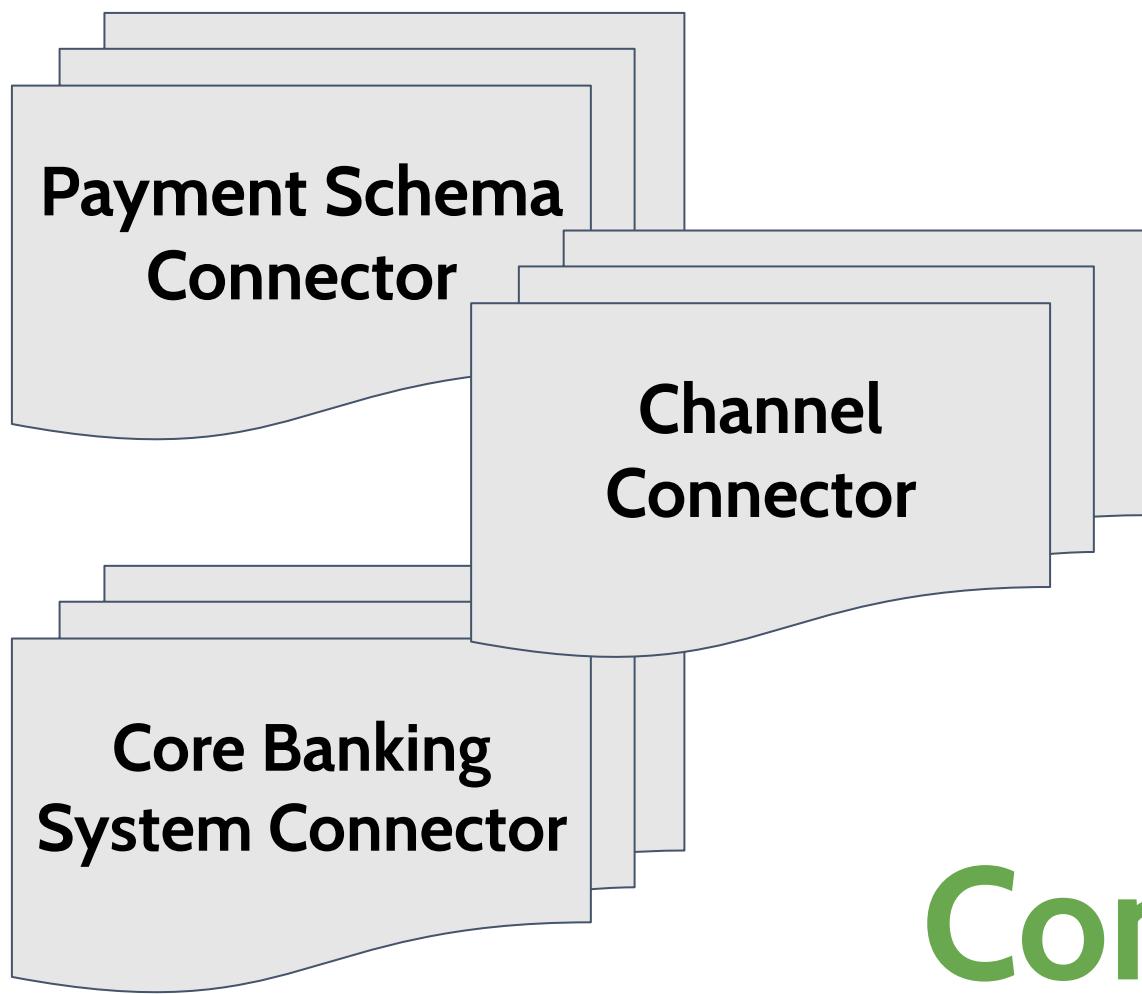

Multi-tenancy of Mifos and Payment Hub EE enabling economies of scale for shared service providers

Mifos network of local on-the-ground integrators & support partners with deployment & domain expertise.

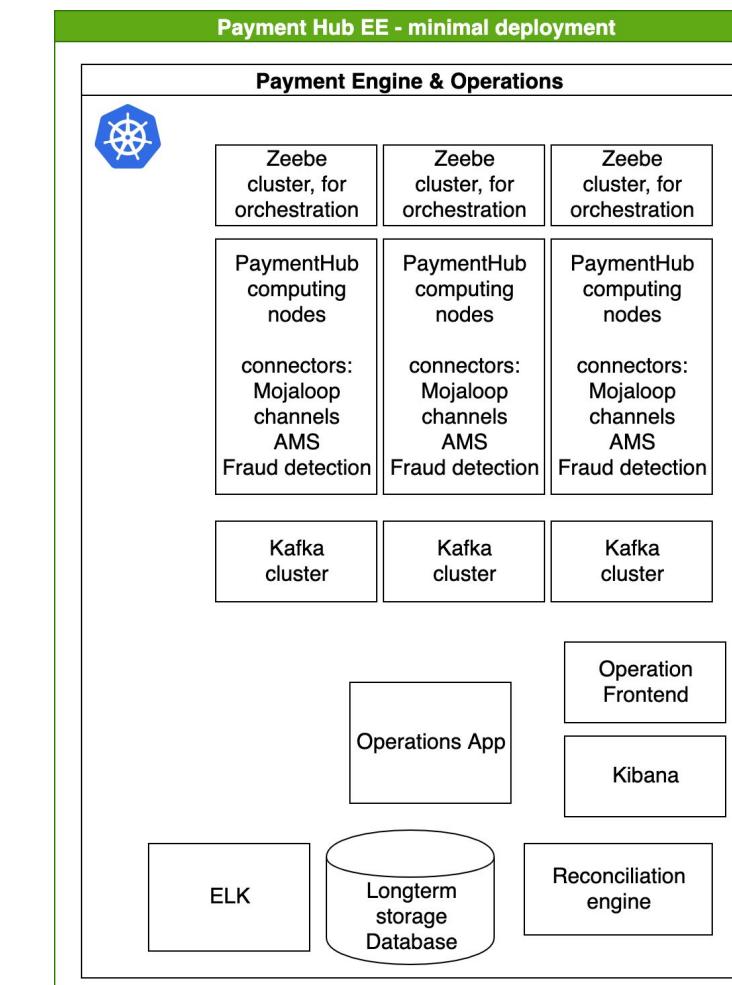

# Benefits of Payment Hub EE

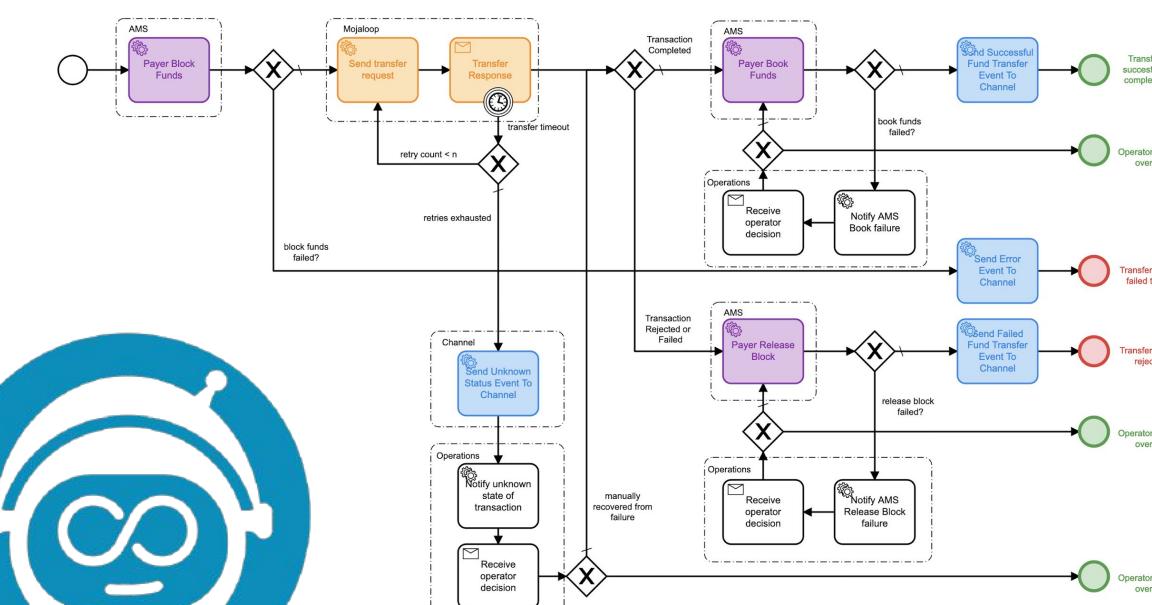

Extensible

Scalable

Configurable

Practical

A screenshot of a web application interface for 'Payment Hub EE'. The top navigation bar includes 'Language en-US', 'Refund', and 'BPMN Diagram'. The main content area displays transaction details for a specific ID: 2251799814249533. It shows the 'Payer' (MSISDN: 27710306999, DFSP Id: in03tn06, DFSP Name: Gorilla Bank) and 'Payee' (MSISDN: 27710101999, DFSP Id: ir01tn01, DFSP Name: Buffalo Bank). The 'Transfer' section provides details: Transfer Code 58f4aea5-8cc4-404f-98ee-191ef1fc02b9, Transfer Amount 215, Transfer Currency TZS, Transfer Completed 2020-07-22 10:54:15, and Transfer Status COMPLETED. The 'Fees' section shows a Payer quote code d205505-beb0-4a7f-91df-92fb2e99368b and a Payee quote code 0 TZS.

## Tier 1 DFSPs

Robust Performance  
Deployment Flexibility  
Ease of Connecting  
Operational Controls  
Seamless Channel Integration

- Core Banking System Agnostic
- Highly configurable workflow engine
- Extensible via connectors
- Ready to customize and extend
- Vendor-agnostic
- Operational Control Center

## Fintechs

Ease of Connection  
Rapid Innovation  
Sandbox  
API Standardization  
Use Case Prototyping

- OS Reference Apps
- Interactive Lab Environment
- End to End OS Stack for DFS
- Open Banking API Layer
- GSMA Mobile Money API support

## Regulators

Transparency & Visibility  
More input into Fraud Detection  
Velocity of Cash

- DFSP-level fraud monitoring
- Visibility into on-us transactions
- Generate regulatory reports
- Consistency of data
- User Access for regulators

# Advancing Traction & Deployments

# Payment Hub EE Traction

## Where's it Being Deployed in Mifos Ecosystem

- ❑ Cross-border Payments Network between USA & India
- ❑ Bulk Disbursements for Banco del Bienestar in Mexico
- ❑ Stokvel Digitization in South Africa
- ❑ SACCO Digitization in Kenya
- ❑ Mobile Wallet in Cote D'Ivoire
- ❑ Rural Bank Digitization in Ghana
- ❑ Ministry of Education in Sierra Leone
- ❑ Modernizing payment infrastructure in Europe

## Additional Connectors

- ❑ Payment Schema
  - ❑ In-Progress
    - ❑ M-Pesa (Kenya)
    - ❑ SPEI (Mexico)
    - ❑ Africell & MTN (Sierra Leone)
  - ❑ Under Consideration
    - ❑ Aza Finance
    - ❑ Interac (Canada)
    - ❑ MFS Africa
- ❑ Channels
  - ❑ GSMA Mobile Money
  - ❑ Nextgen SIM Overlay

# Demos & Technical Updates

# Payment Hub as an Open Source Asset for the Community

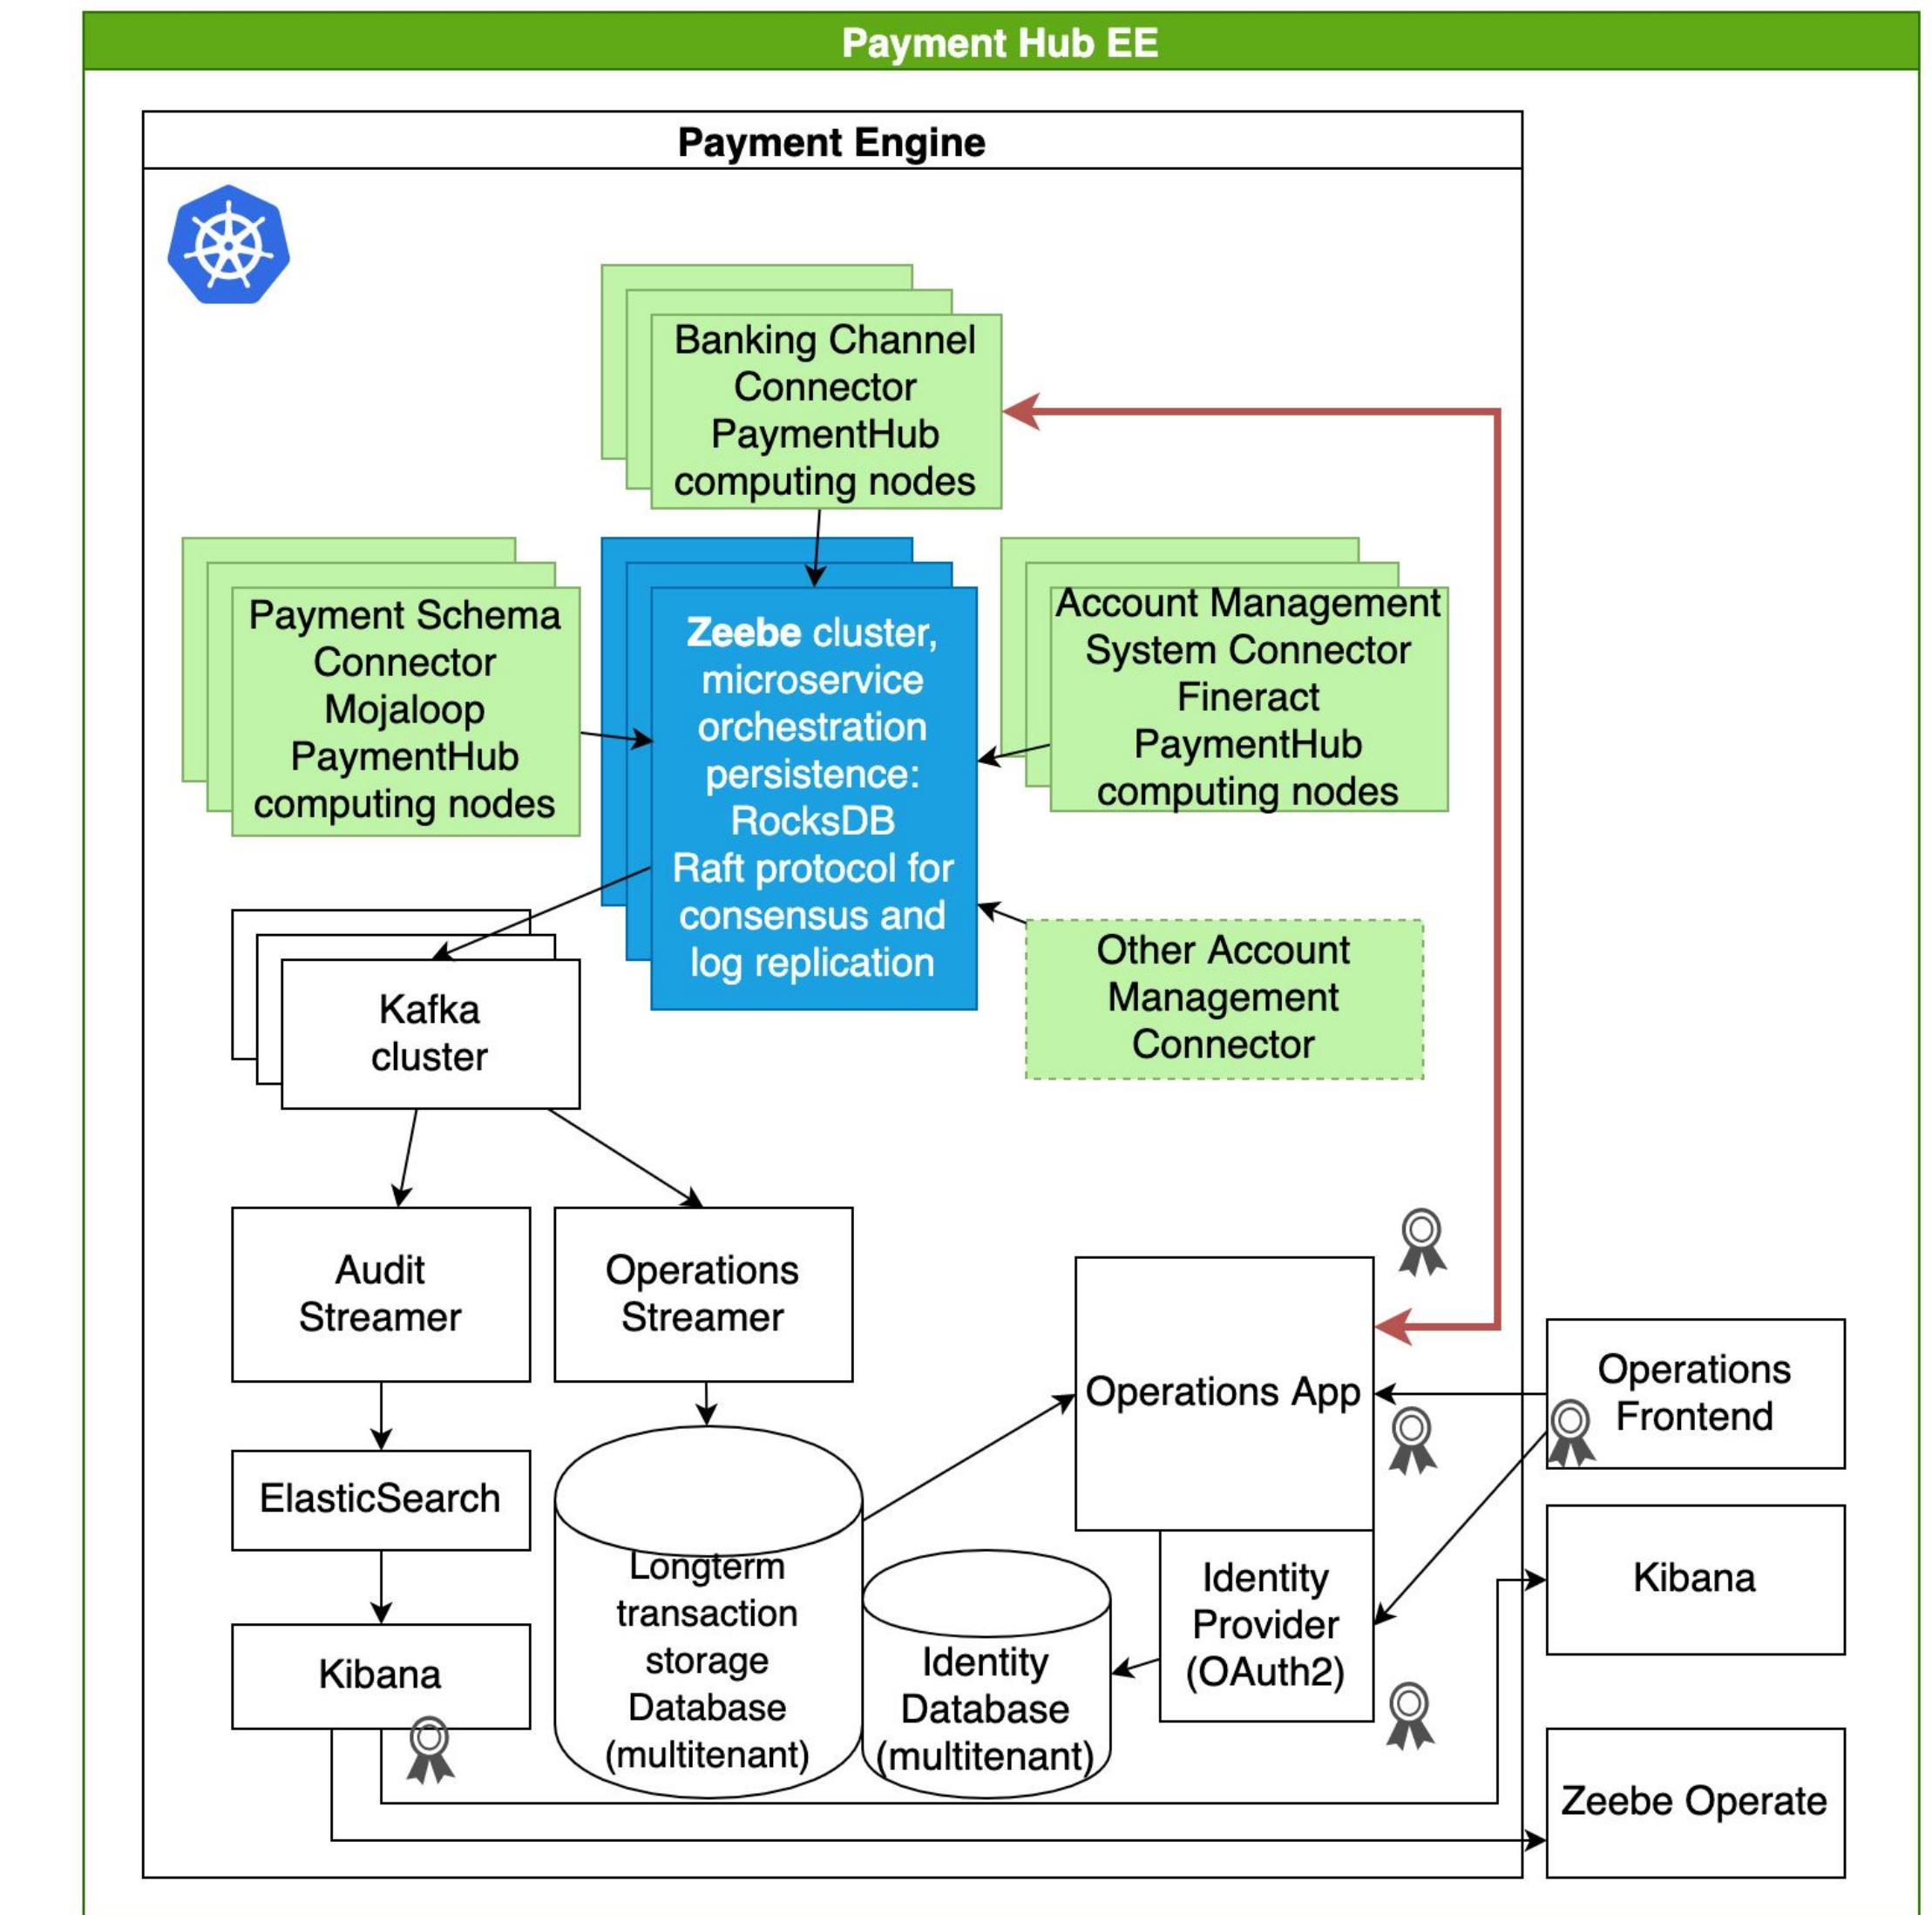

- The role of a payment hub to connect:
  - Financial Institution channels (Mobile, Internet, Branch, Callcenter, ATM, POS, API Gateways)
  - Account Management Systems (AMS / Core banking platform), optionally fraud monitoring tools
  - Payment Schemes, such as Mojaloop
- Need
  - Consistent Way to Connect to Mojaloop
  - Effective Operational Participation
- Additional Capabilities
  - DFSP-level fraud monitoring
  - Bulk Transfer Campaign Management
  - Operational Monitoring
  - Manages the identifier – account relation
  - Trigger notifications
- Built on proven open-source technology:
  - Java, SpringBoot, Kafka, Elasticsearch
  - Apache Camel, Camunda Zeebe
  - Kubernetes

# Payment Hub Components

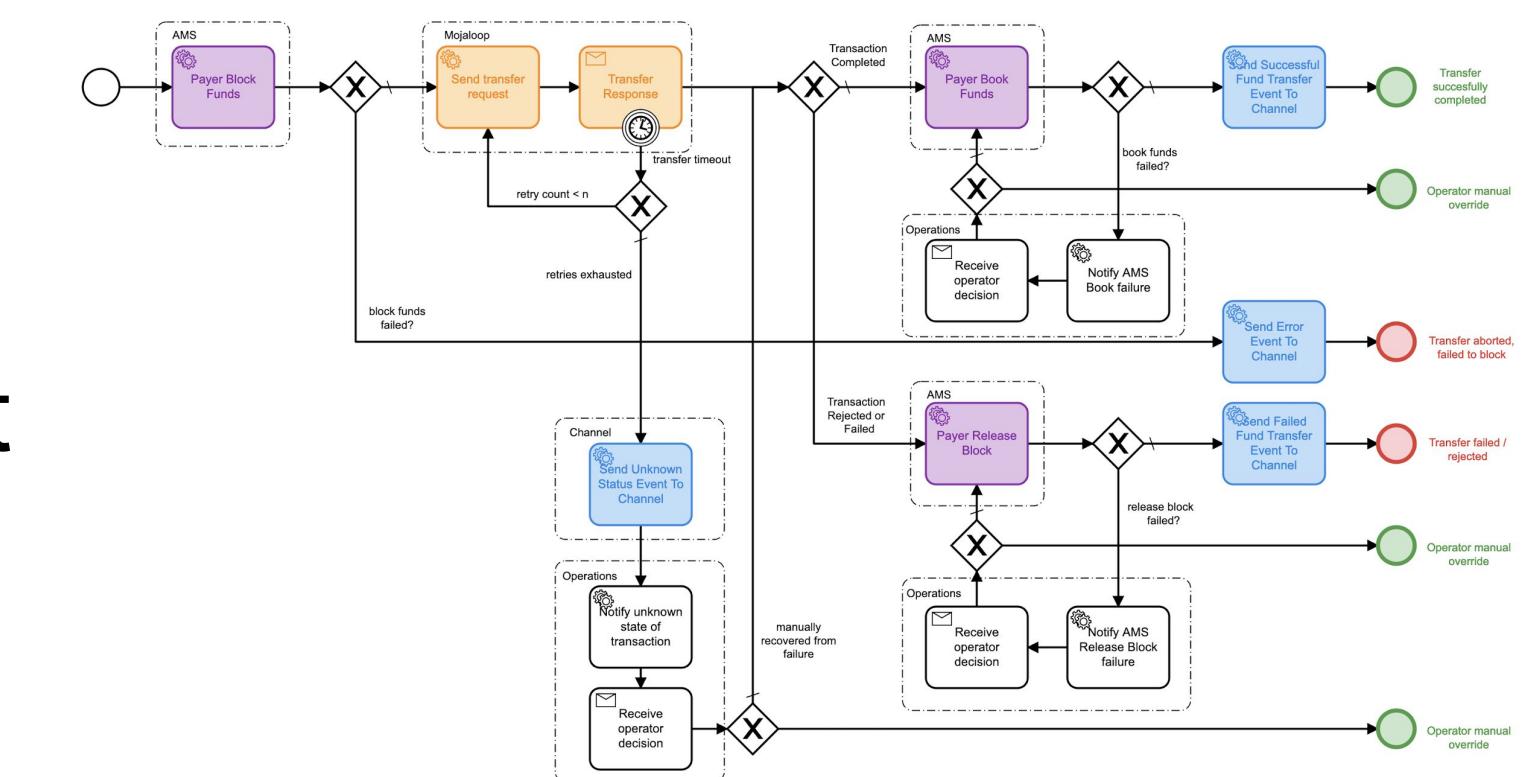

Microservices based architecture to support easy customization for integrators

- microservices orchestration
- microservices for the connectors
- running in a Kubernetes cluster
- operations application for DFSP command center

# Focus on system integrators

- BPMN let implementation team focus on the business flow changes inside the given DFSP, making adoption and customization much easier
- Multi programming language support for component implementation, let implementation team to create the necessary connector components in any of the supported languages, the engine is able to orchestrate the steps. (e.g. multiple AMS integration is required), using gRPC protocol for efficient communication
- **Connector components are stateless, easy and simple implementation**
- No additional components required in the realtime engines, no databases to maintain, all active process states are stored in the embedded RocksDB data store. Auditlogs, and other events are sent to a Kafka cluster before storing them for long term access
- Scalability - using partitioning (sharding), the system scales horizontally to create thousands of workflow instances per second
- Fault tolerance enables, that system recovers from a failure without data loss

# Multitenancy

Single deployment serving multiple DFSPs

Isolated audit logs for the different DFSPs served with separate user databases for the DFSP operators

Benefits:

- . Single operator could provide services for multiple individual DFSPs while sharing operational costs
- . In case using a multi-tenant core banking platform (e.g. Mifos) a single Payment Hub EE deployment could serve all tenants (DFSPs)

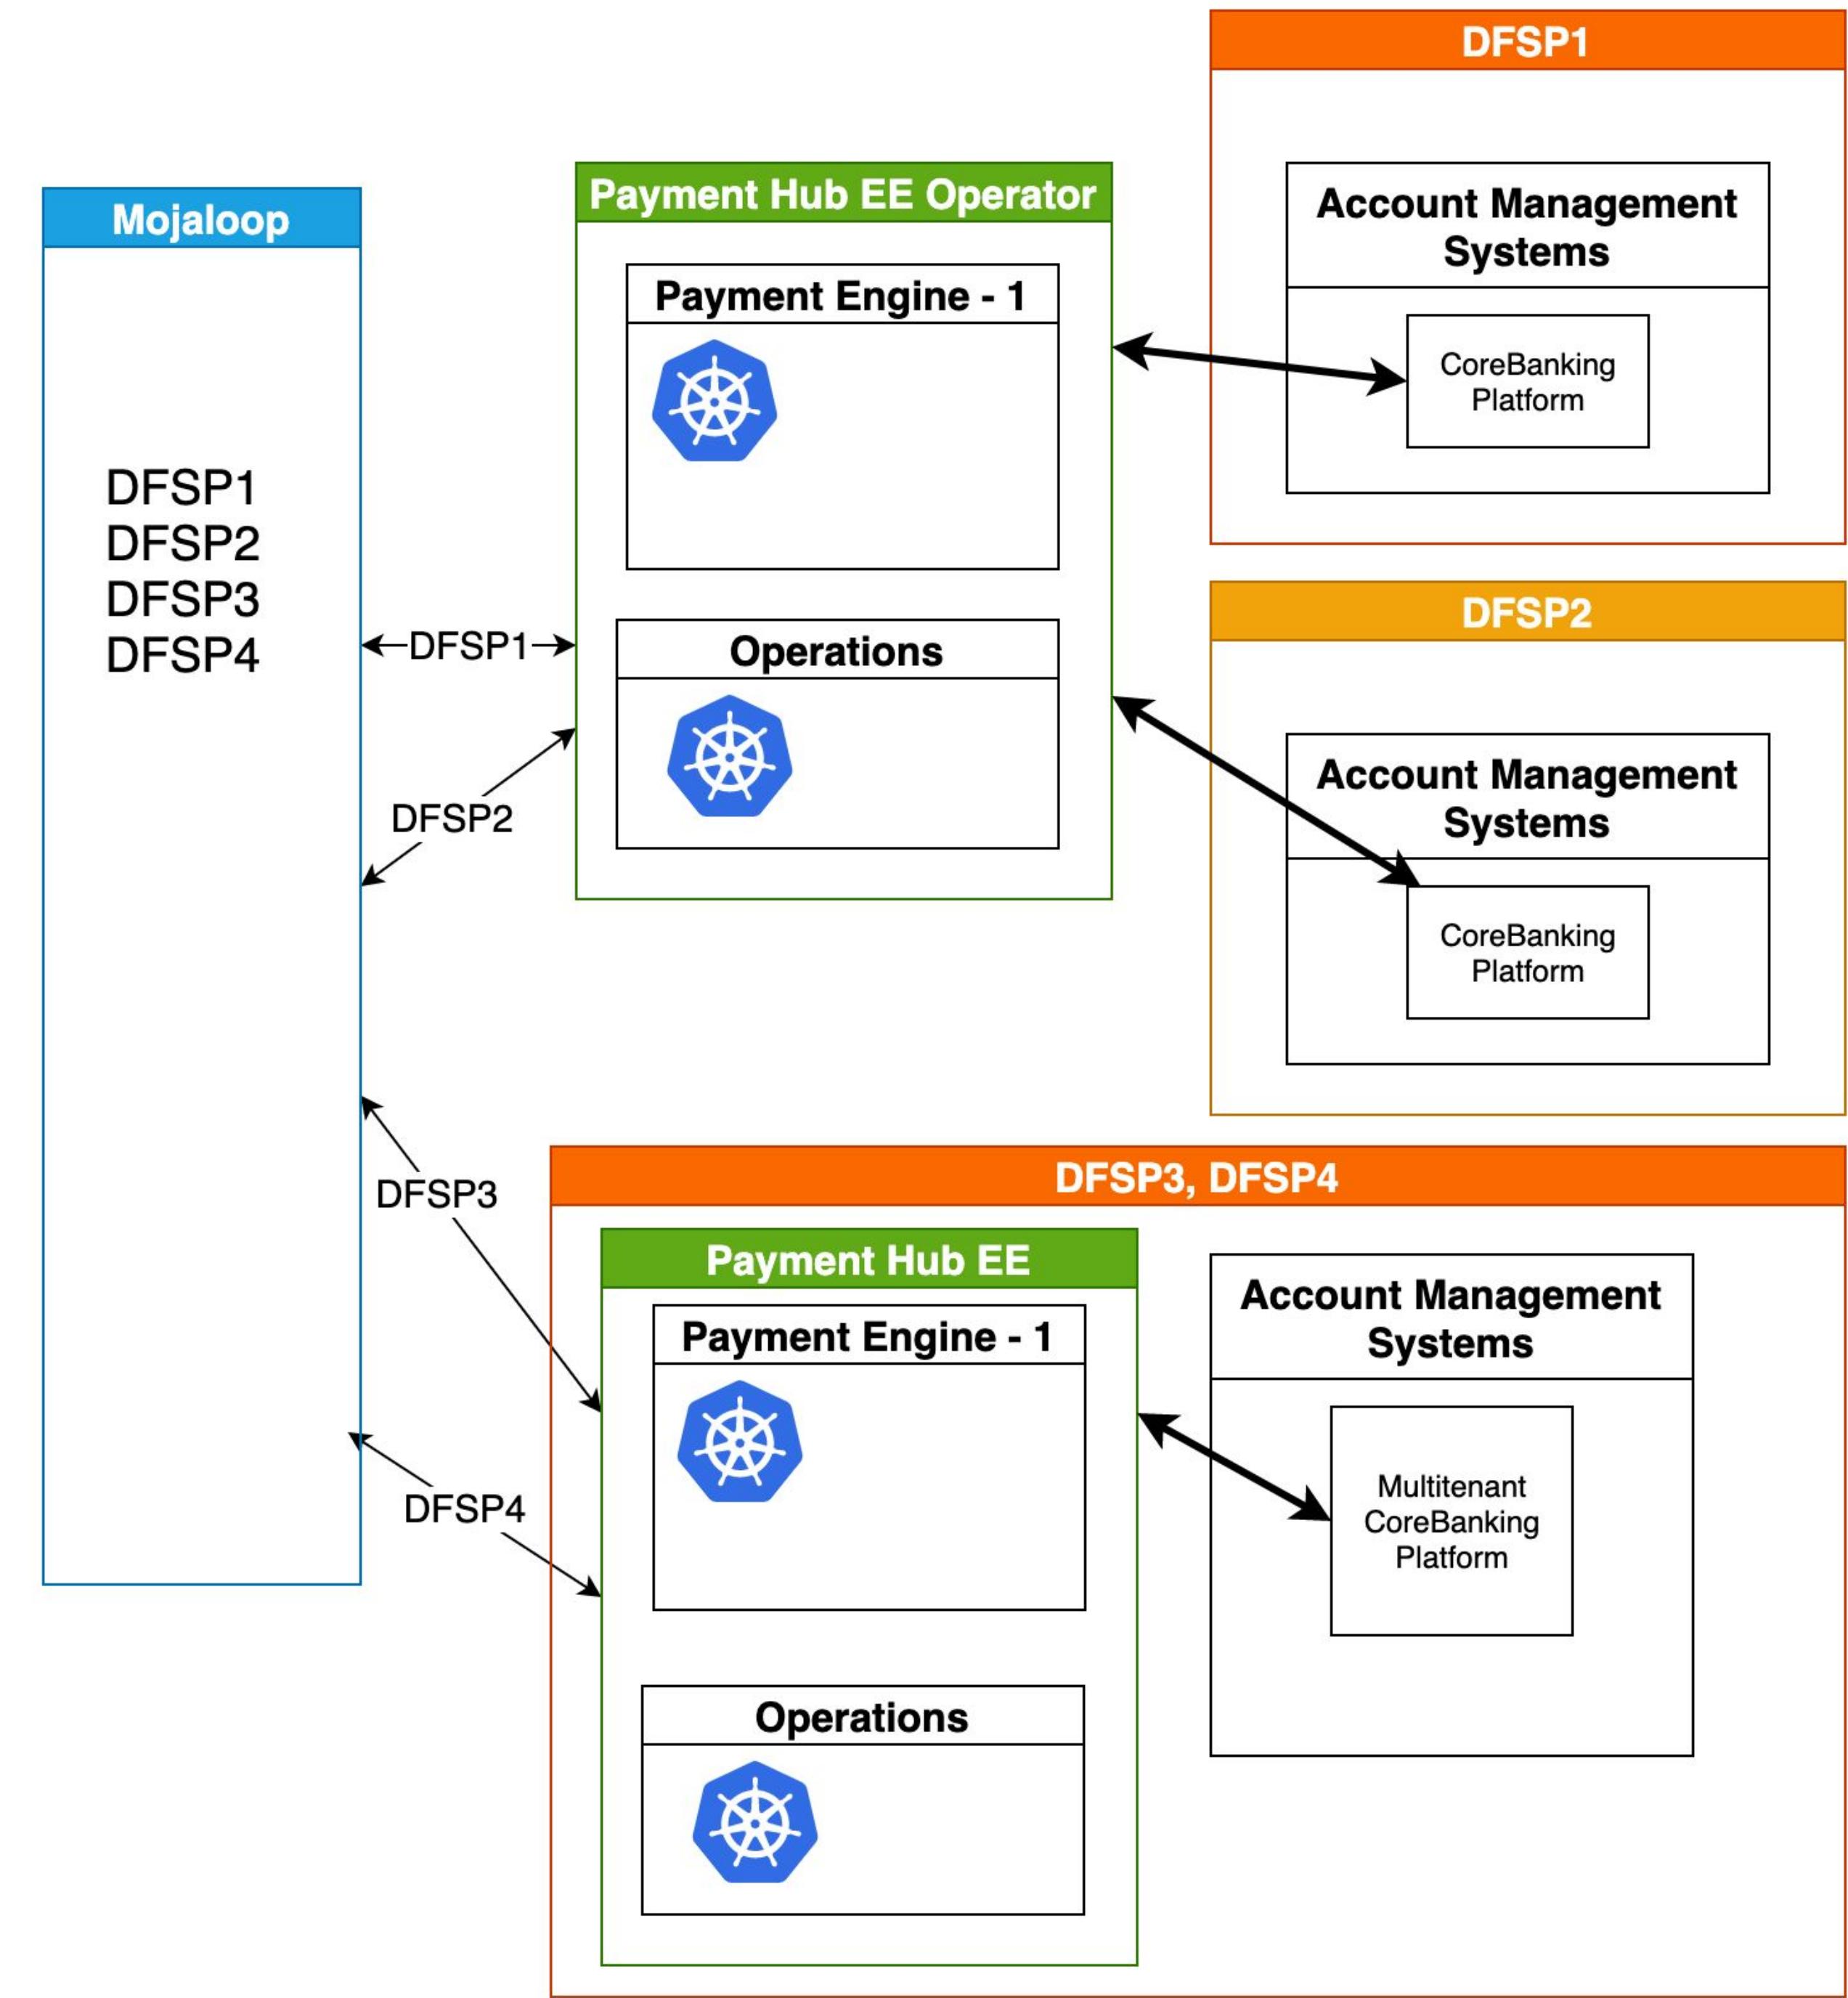

# Multitenancy

Helping adoption for smaller MFIs

- sharing operational cost
- simplifying management
- reduce implementation effort

Aggregator model for multiple smaller DFSPs

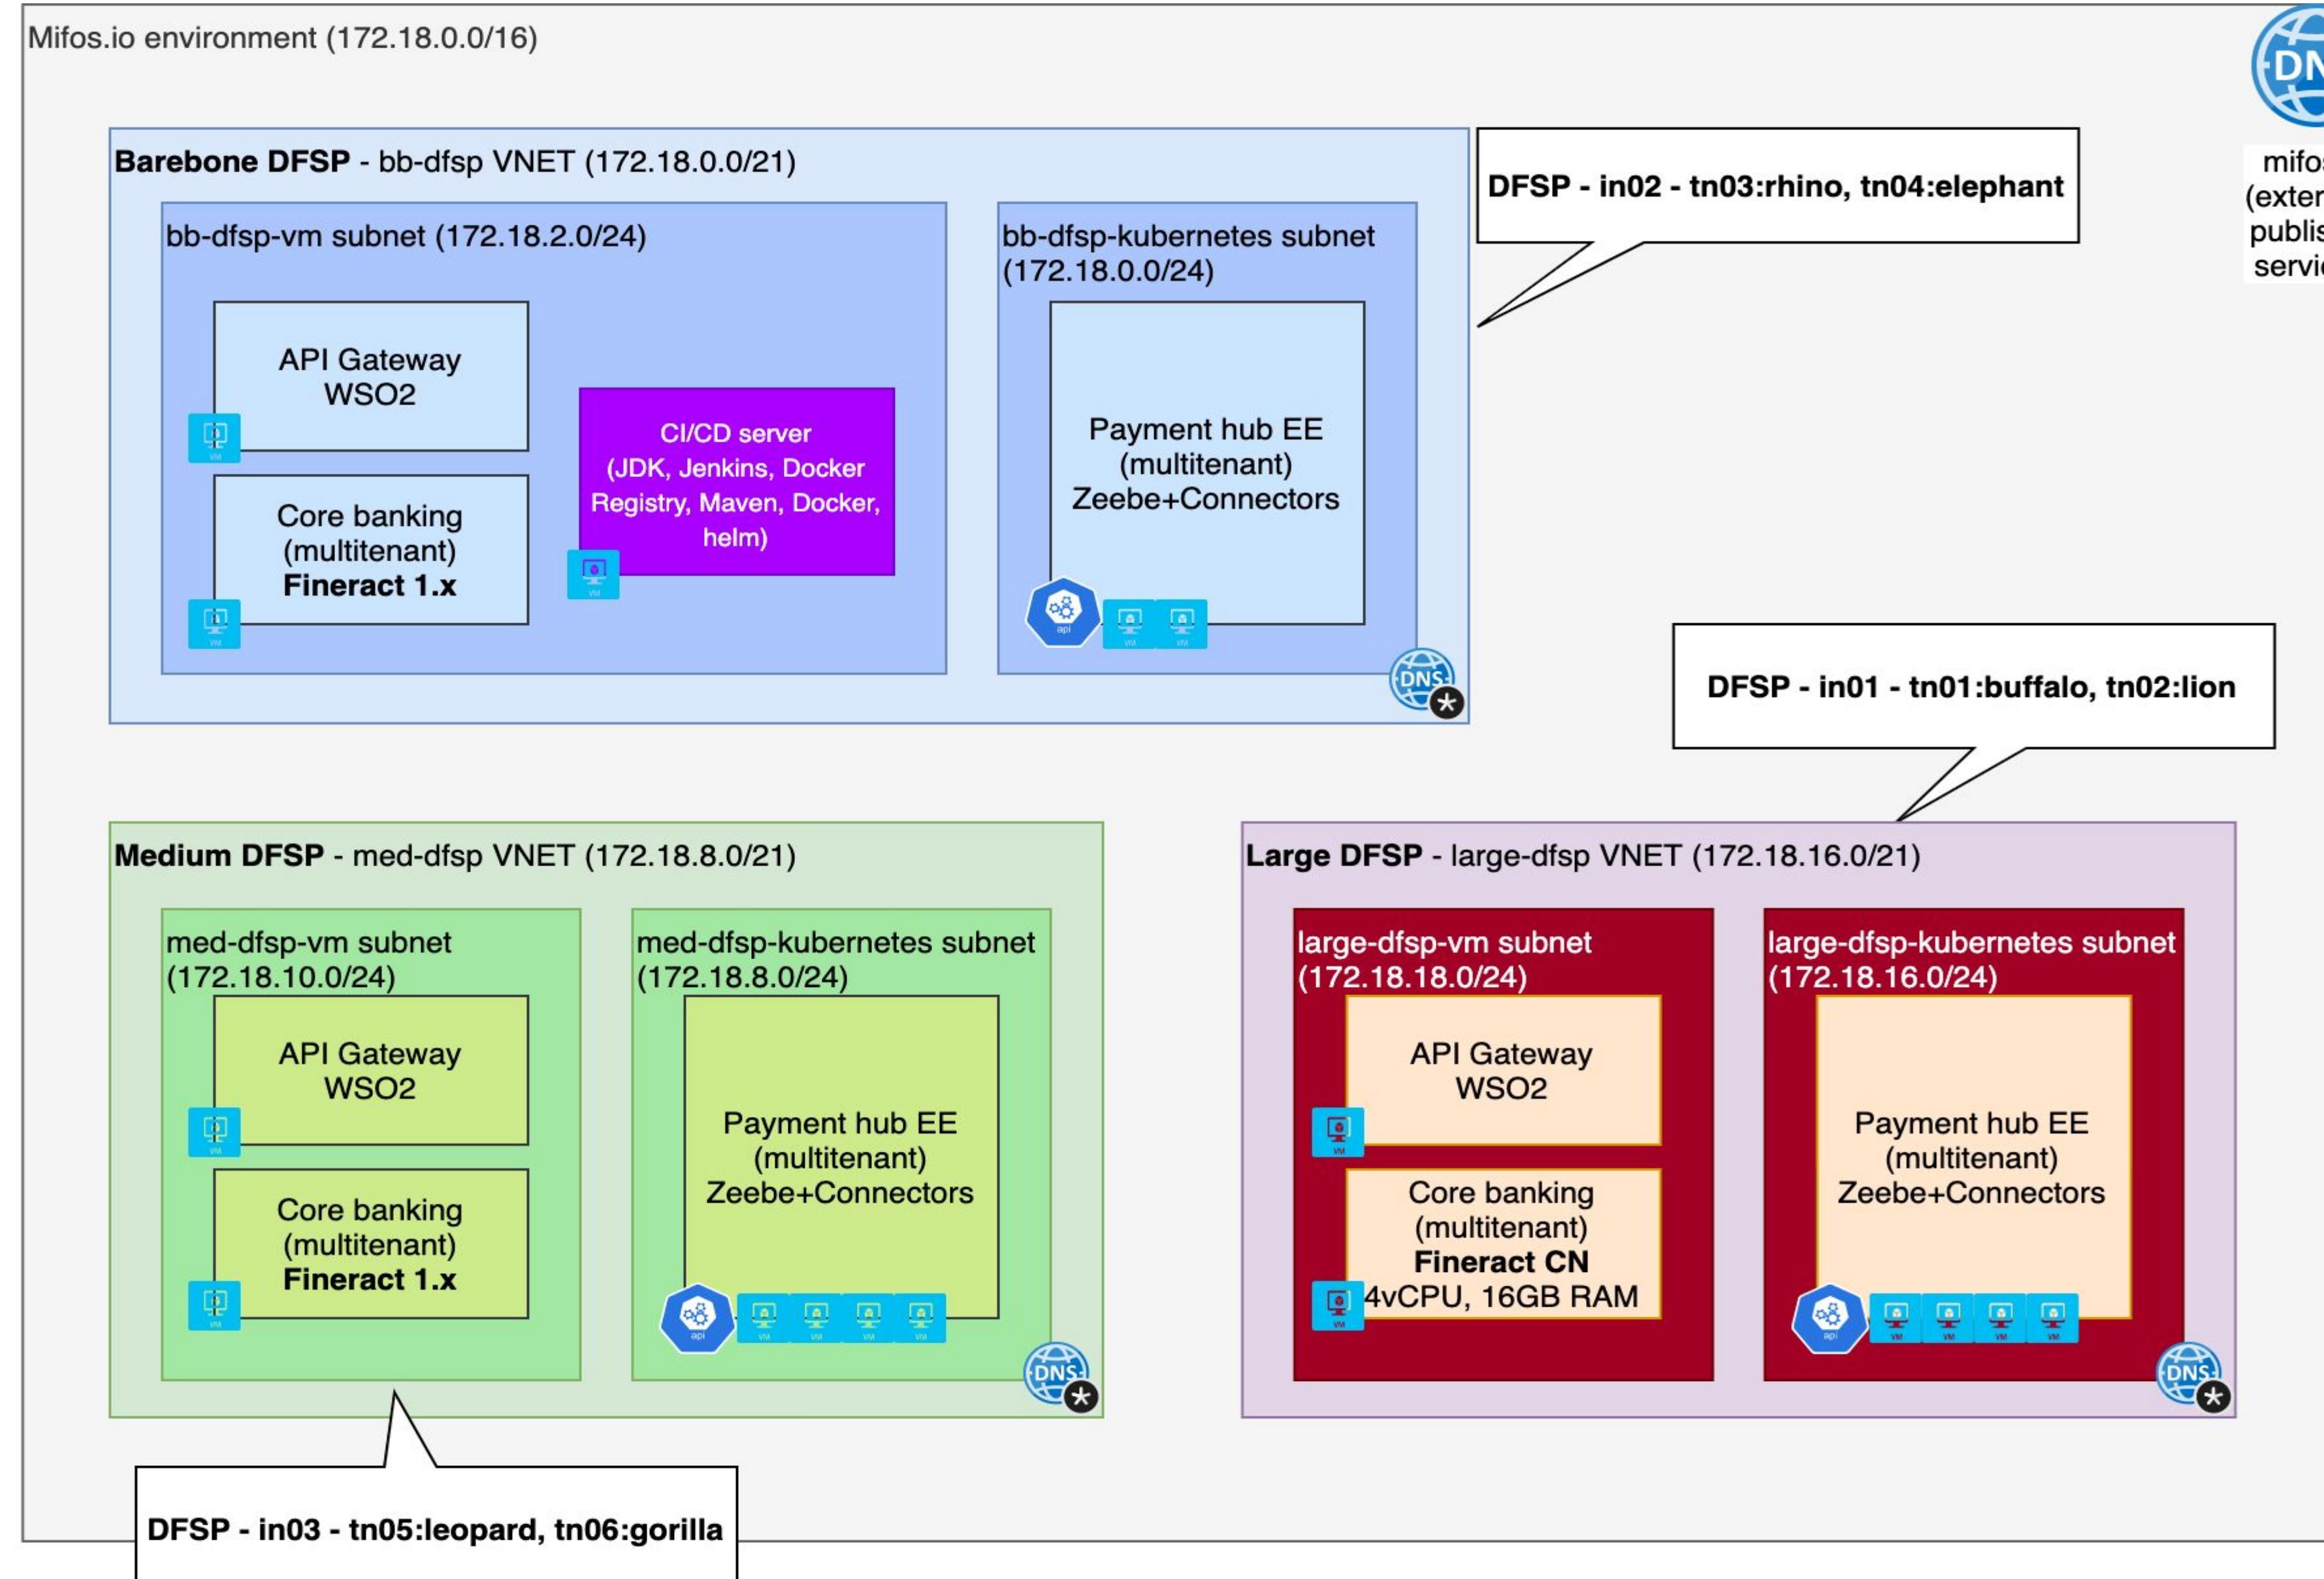

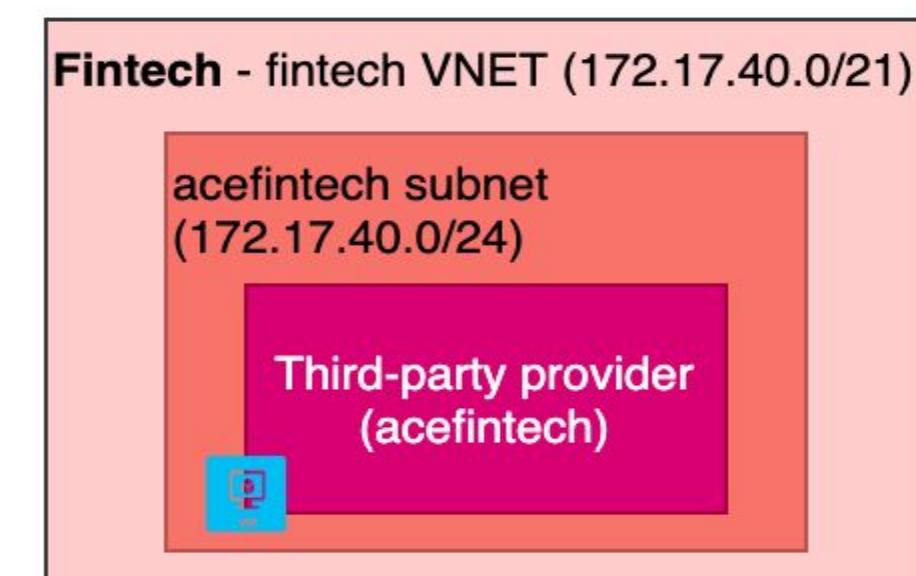

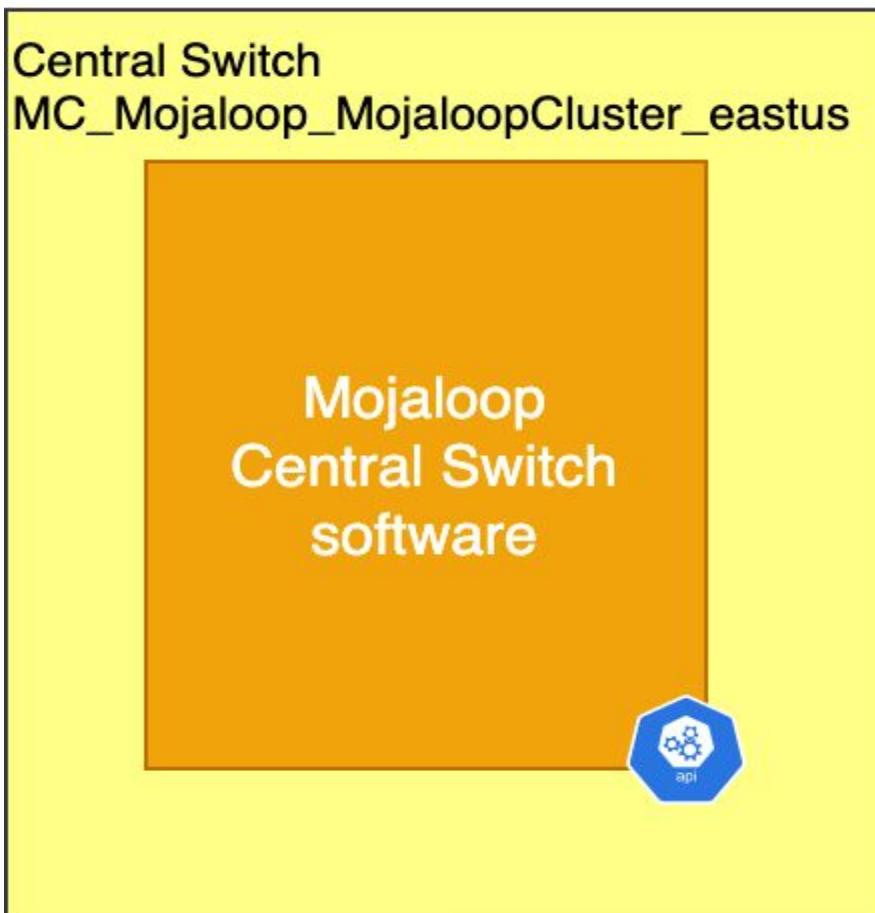

Multitenant model for already aggregated DFSPs served from a single multi-tenant core banking

# Integrated LAB Environment

- 3 independent deployments
- 2 Mifos 1.x and 1 Mifos CN multitenant core banking deployments
- 2 DFSPs in each deployment unit utilising the multitenant capability of Fineract (one tenant corresponds to a DFSP)
- 1 Mojaloop instance to enable instant payments across the 6 DFSPs
- 1 Fintech application to utilise the OpenBanking APIs provided by the DFSPs. This enables to demonstrate an account information aggregation and payment initiation third party
- 1 CI/CD server to be able to build and deploy the various microservices of the payment hub
- Join the Mifos Slack to get access to the environment!

# Mifos Lab - Full featured lab environment

mifos.io  
(externally  
published  
services)

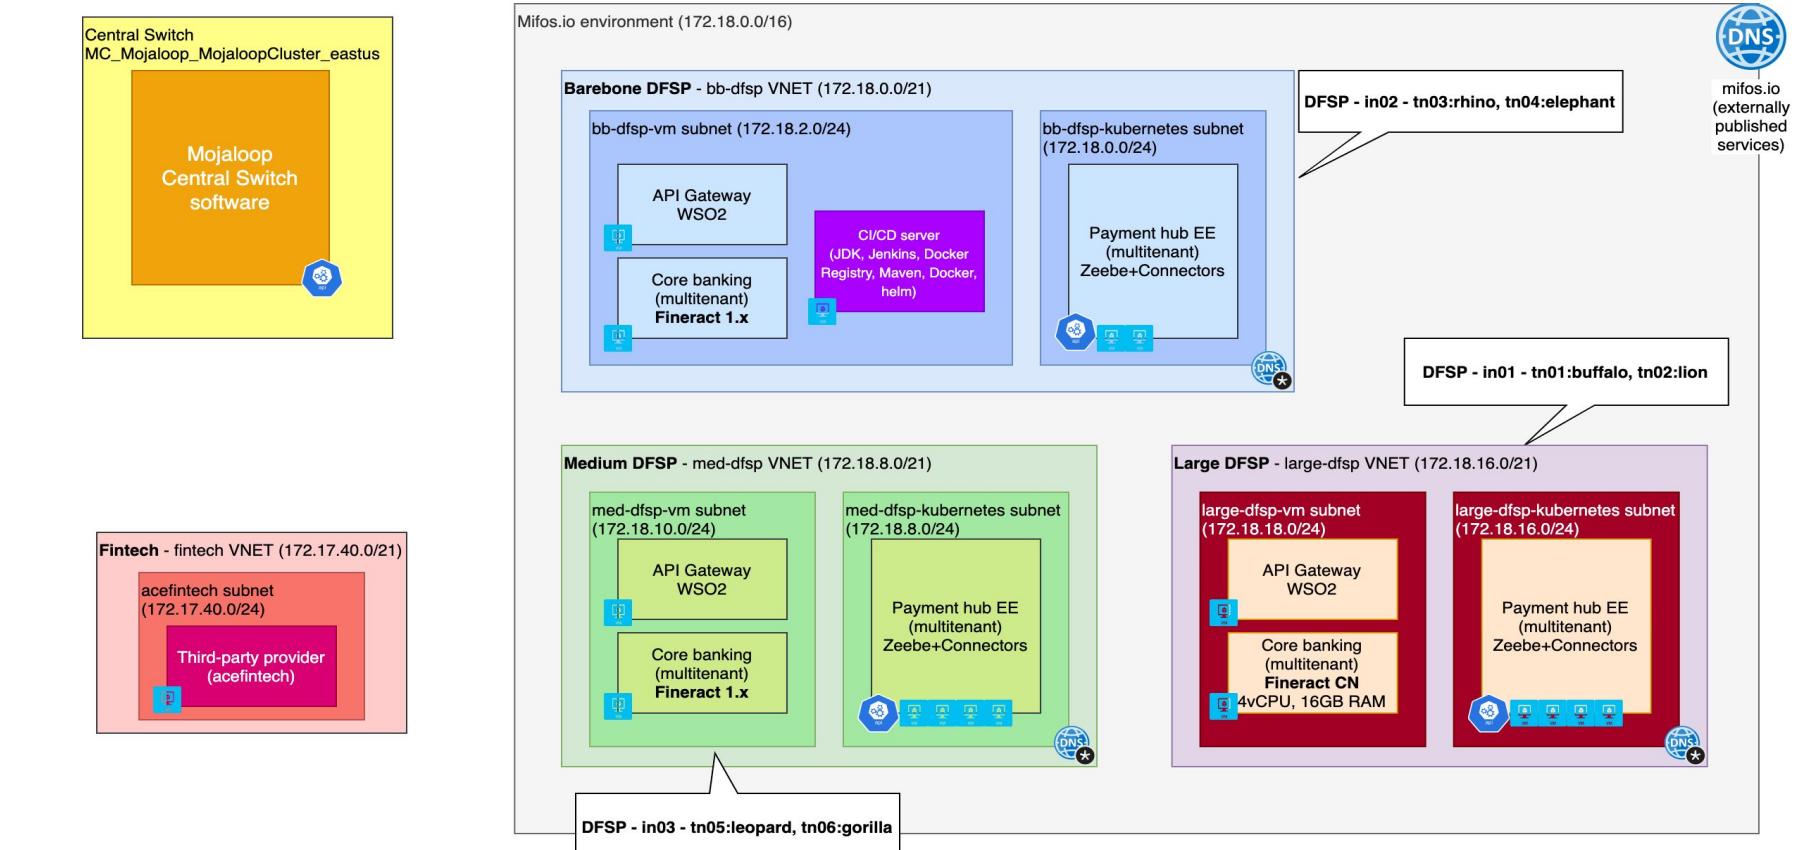

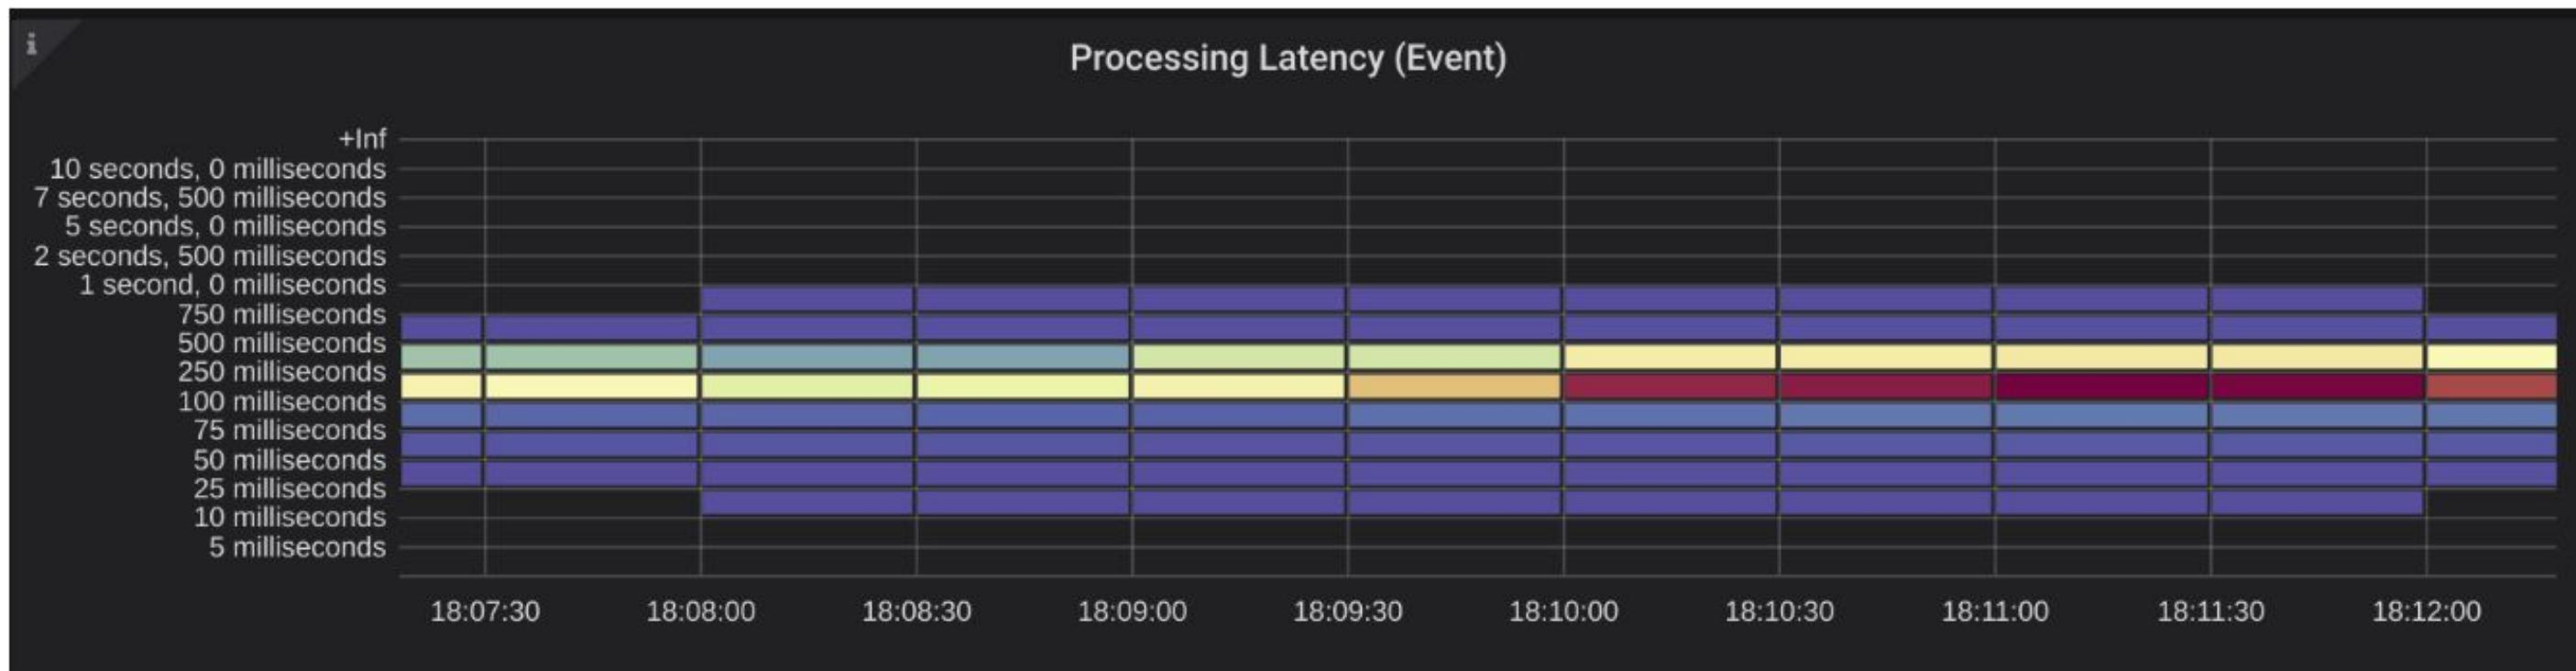

# Performance measurements

## Payment Hub EE Large Lab Environment

- 4 nodes Kubernetes cluster on Azure (3 x 8 cpu core, 56Gb ram, 1 x 2 cpu core, 2Gb ram)

## Test benchmark

- 10000 complete payment transaction flows
- number of parallelly running workflow instances peaked over 5200 workflows
- all transactions finished within 3:15, hitting the **average of 51 cfTPS**
- single event process latency primarily within 100-250ms
- executing payment transfer operations with over 300 fTPS

# Tuning

**Performance tuning documentation in the PHEE Handbook:**

<https://mifos.gitbook.io/docs/payment-hub-ee/overview/tuning-and-performance>

## Primary tuning considerations

- Zeebe orchestration engine parameters (partitions count, replication factor, CPU / IO thread counts, JVM garbage collector options)
- replace built-in Elasticsearch exporter with PHEE's improved asynchronous Elasticsearch exporter
- tune backpressure options / disable for throughput benchmarks
- enable Prometheus metrics to get the necessary insights
- tune the number of connector pods & worker thread counts in the clusters to match the target load
- running on AMD cpus seems to have a serious impact on performance (under validation)

# Load testing and measurements

# Crossnetwork - ISO20022 (Payments Clearing and Settlement - pacs.008, pacs.002) - Mojaloop

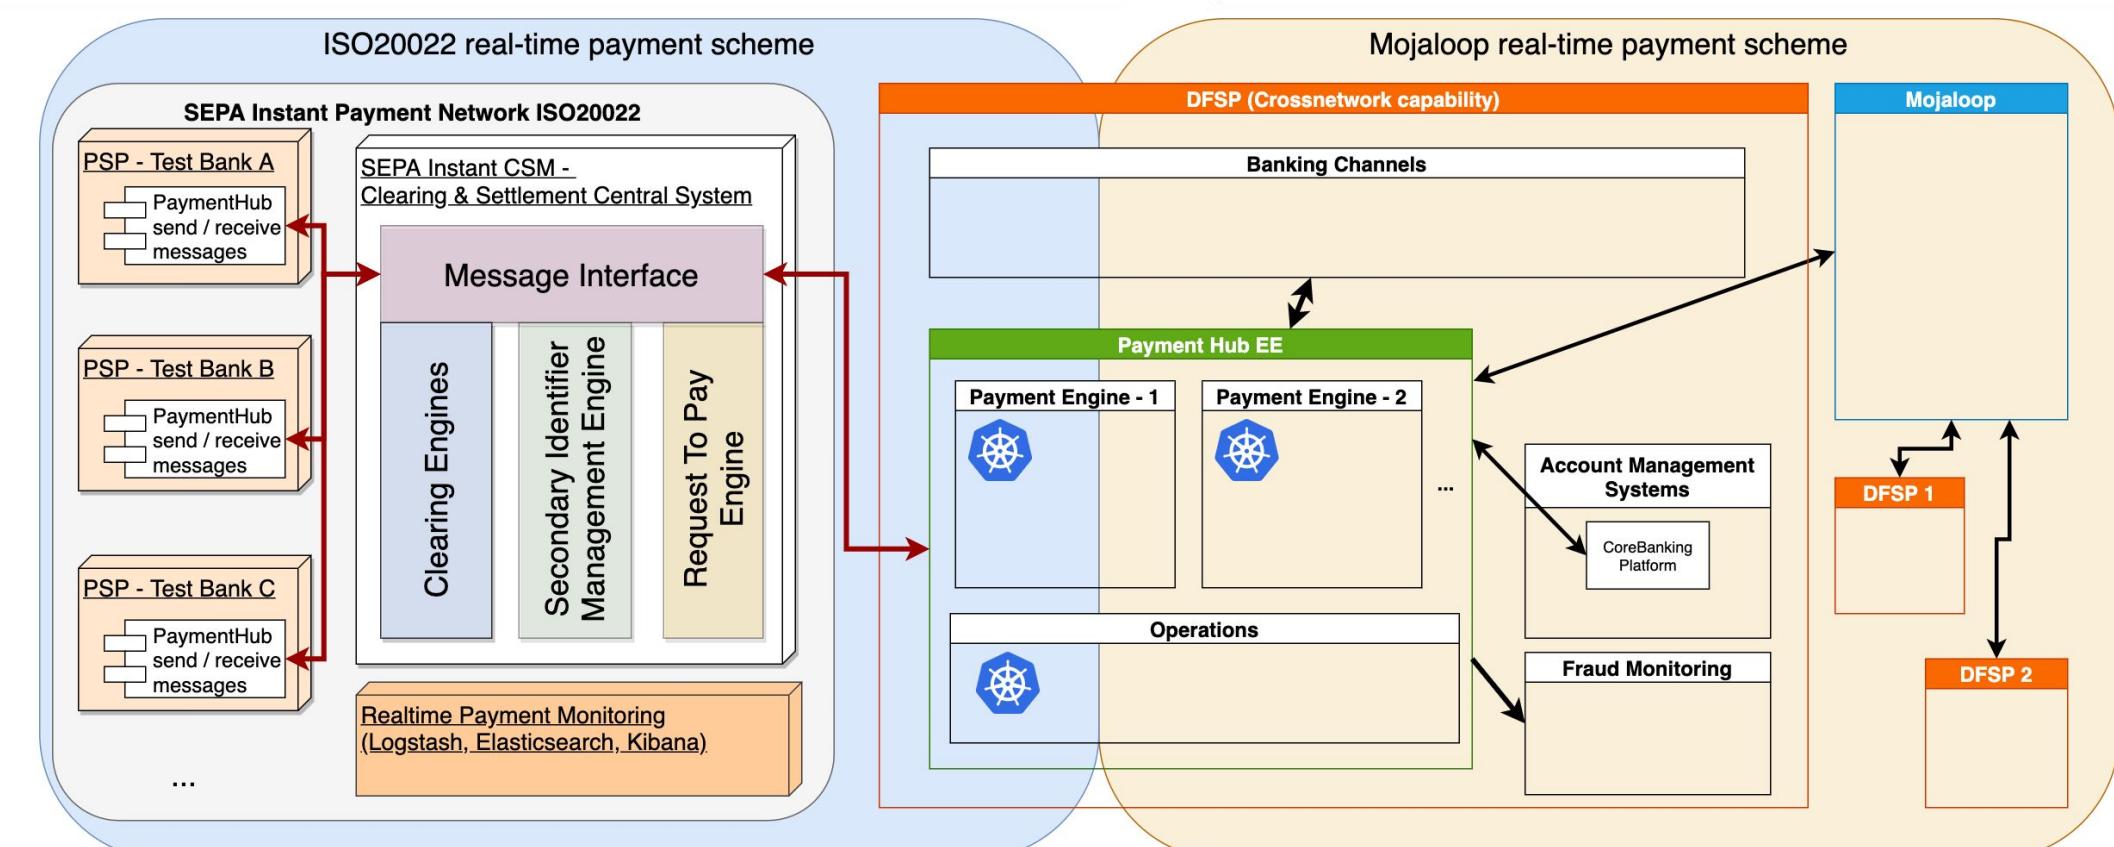

# Crossnetwork - ISO20022 (Payments Clearing and Settlement - pacs.008, pacs.002) - Mojaloop

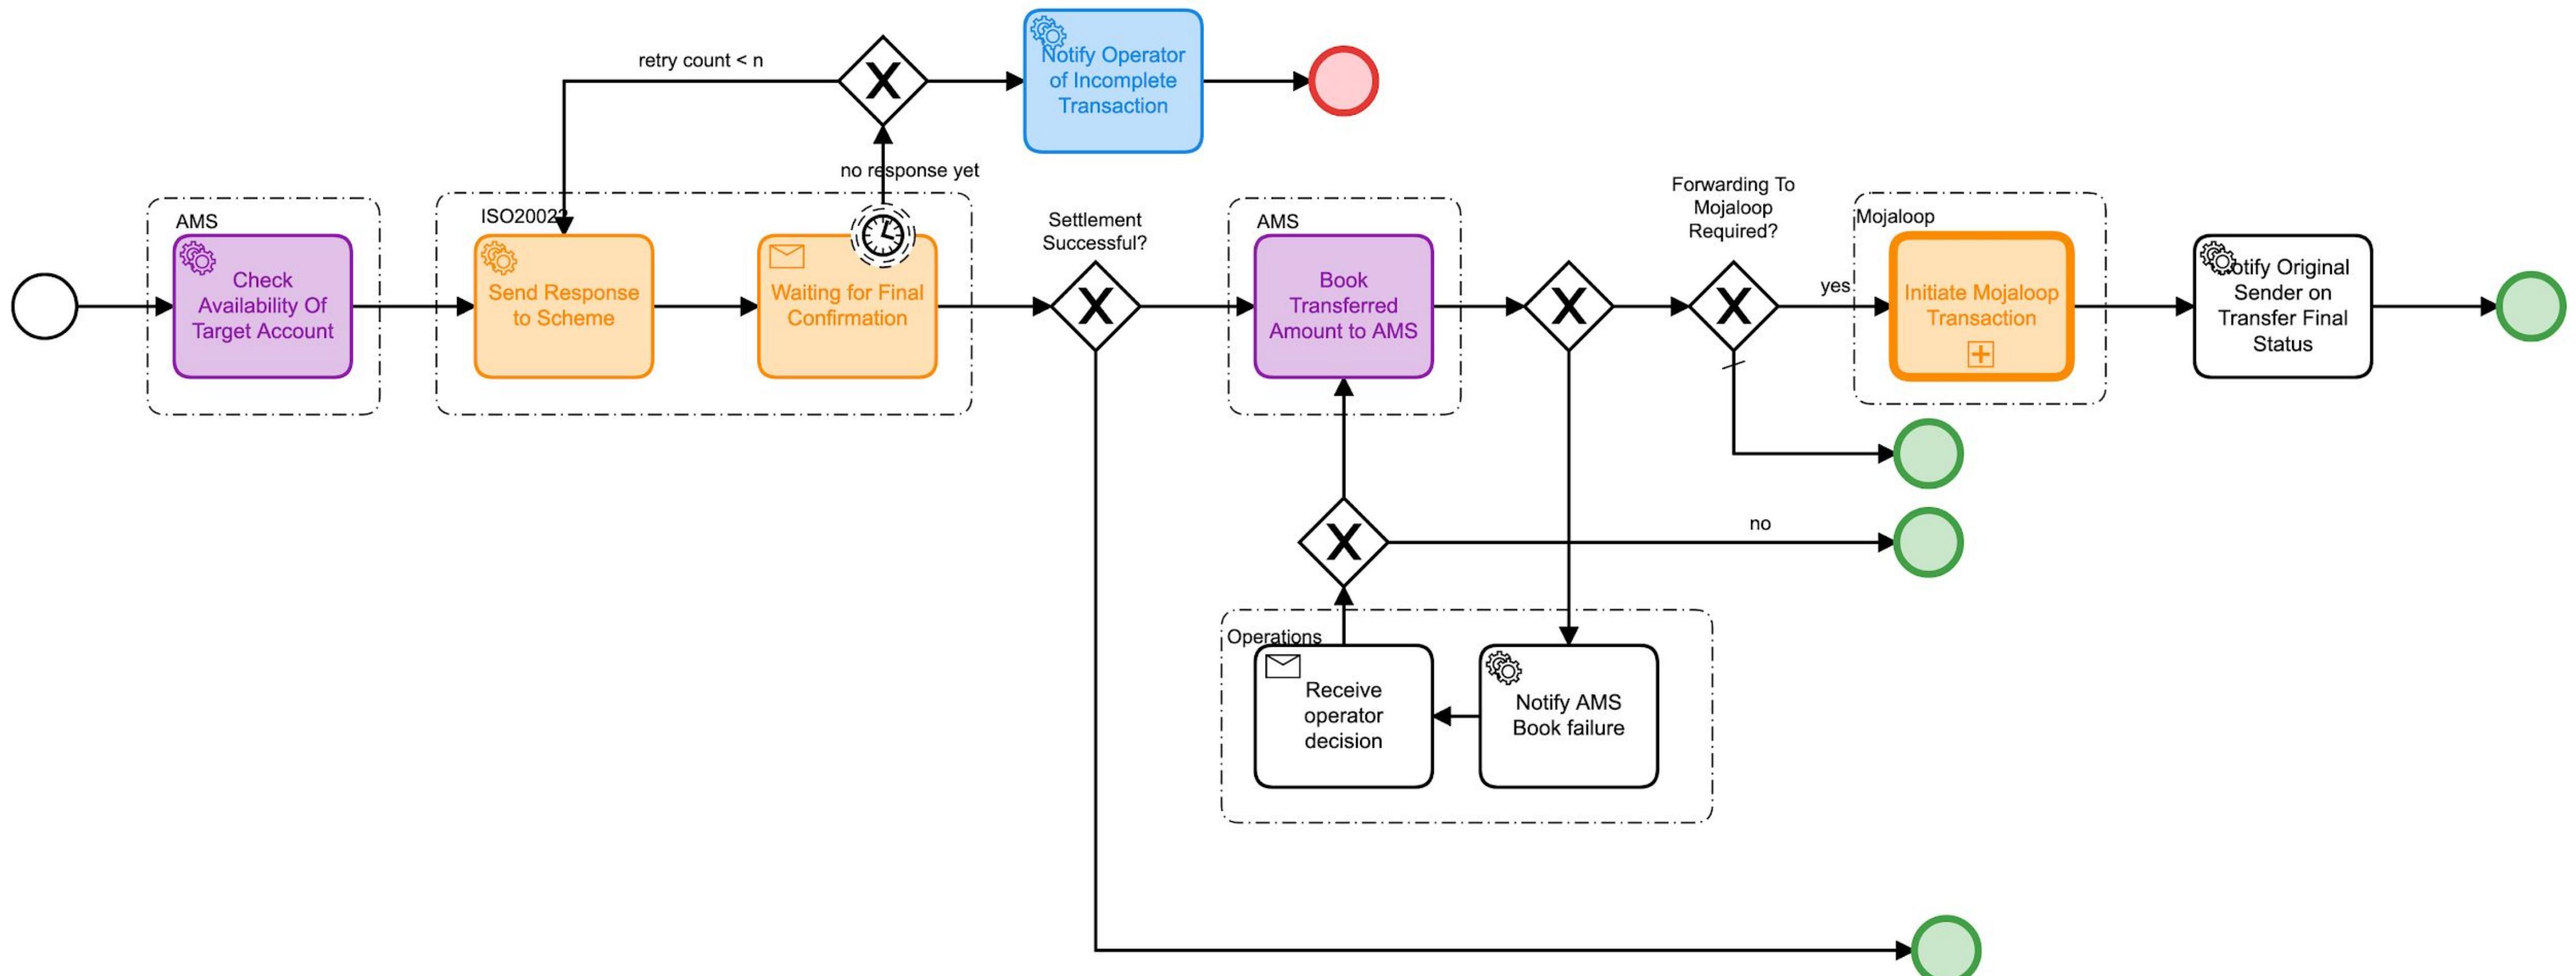

# Crossnetwork - ISO20022 - Testing

The image displays two screenshots of a software interface. The left screenshot shows the 'Run Test Suite' section of the 'Giro Instant Simulator'. It lists several test files on the left, including 'AFR-PHB-GRA.xlsx', 'AFR-PHB-IZB.xlsx', 'AFR-PHB-Ref.xlsx', 'AFR-IZB-PHB.xlsx', 'AFR-IZB-GRA.xlsx', 'AFR-Tax-Delay.xlsx', 'AFR-Tax-FLICT.xlsx', 'AFR-Tax-Suite01.xlsx', 'AFR-Tax-Suite02.xlsx', 'AFR-Tax-Unit.xlsx', 'AFR-Tax-Unit01.xlsx', 'AFR-Tax-unit', 'FH-EH-FHS-TA-CH-EL-01.xlsx', 'SuccessfulRequestLog.xlsx', and 'SuccessfulRequestLog-NVH-01.xlsx'. The right side shows 'Run Test Suite Details' with fields for 'File' (set to 'SuccessfulCreditTransfer.xlsx'), 'TPS' (set to 2), 'Iteration Count' (set to 10), and 'Start at' (radio buttons for 'ASAP' and 'Next Minute', with 'ASAP' selected). A green success message at the bottom states: '06:02:51 Test Suite was successfully queued. Reason: SuccessfulCreditTransfer.xlsx'. Below this are four buttons: 'Run Test Suite' (blue), 'Download File' (dark blue), 'Delete Suite' (dark red), and 'Terminate All' (dark red). The right screenshot shows a 'Test results' dashboard in Kibana. It features various charts and graphs, including bar charts for 'Count' (100,000), 'Sum of amount' (750,457,942), and 'Average amount' (7,504.579); line graphs for 'Accepted count' (70,000) and 'Rejected count' (30,000); and pie charts for 'Status' (Success, Pending, Failed) and 'Type' (e.g., ACR, CDR, TCR, TRC). The top navigation bar includes links for 'Create Test Suite', 'Run Test Suite', 'Test results', 'Dashboard', 'Search', 'Logout', and 'Help'.

# Crossnetwork BPMN flow

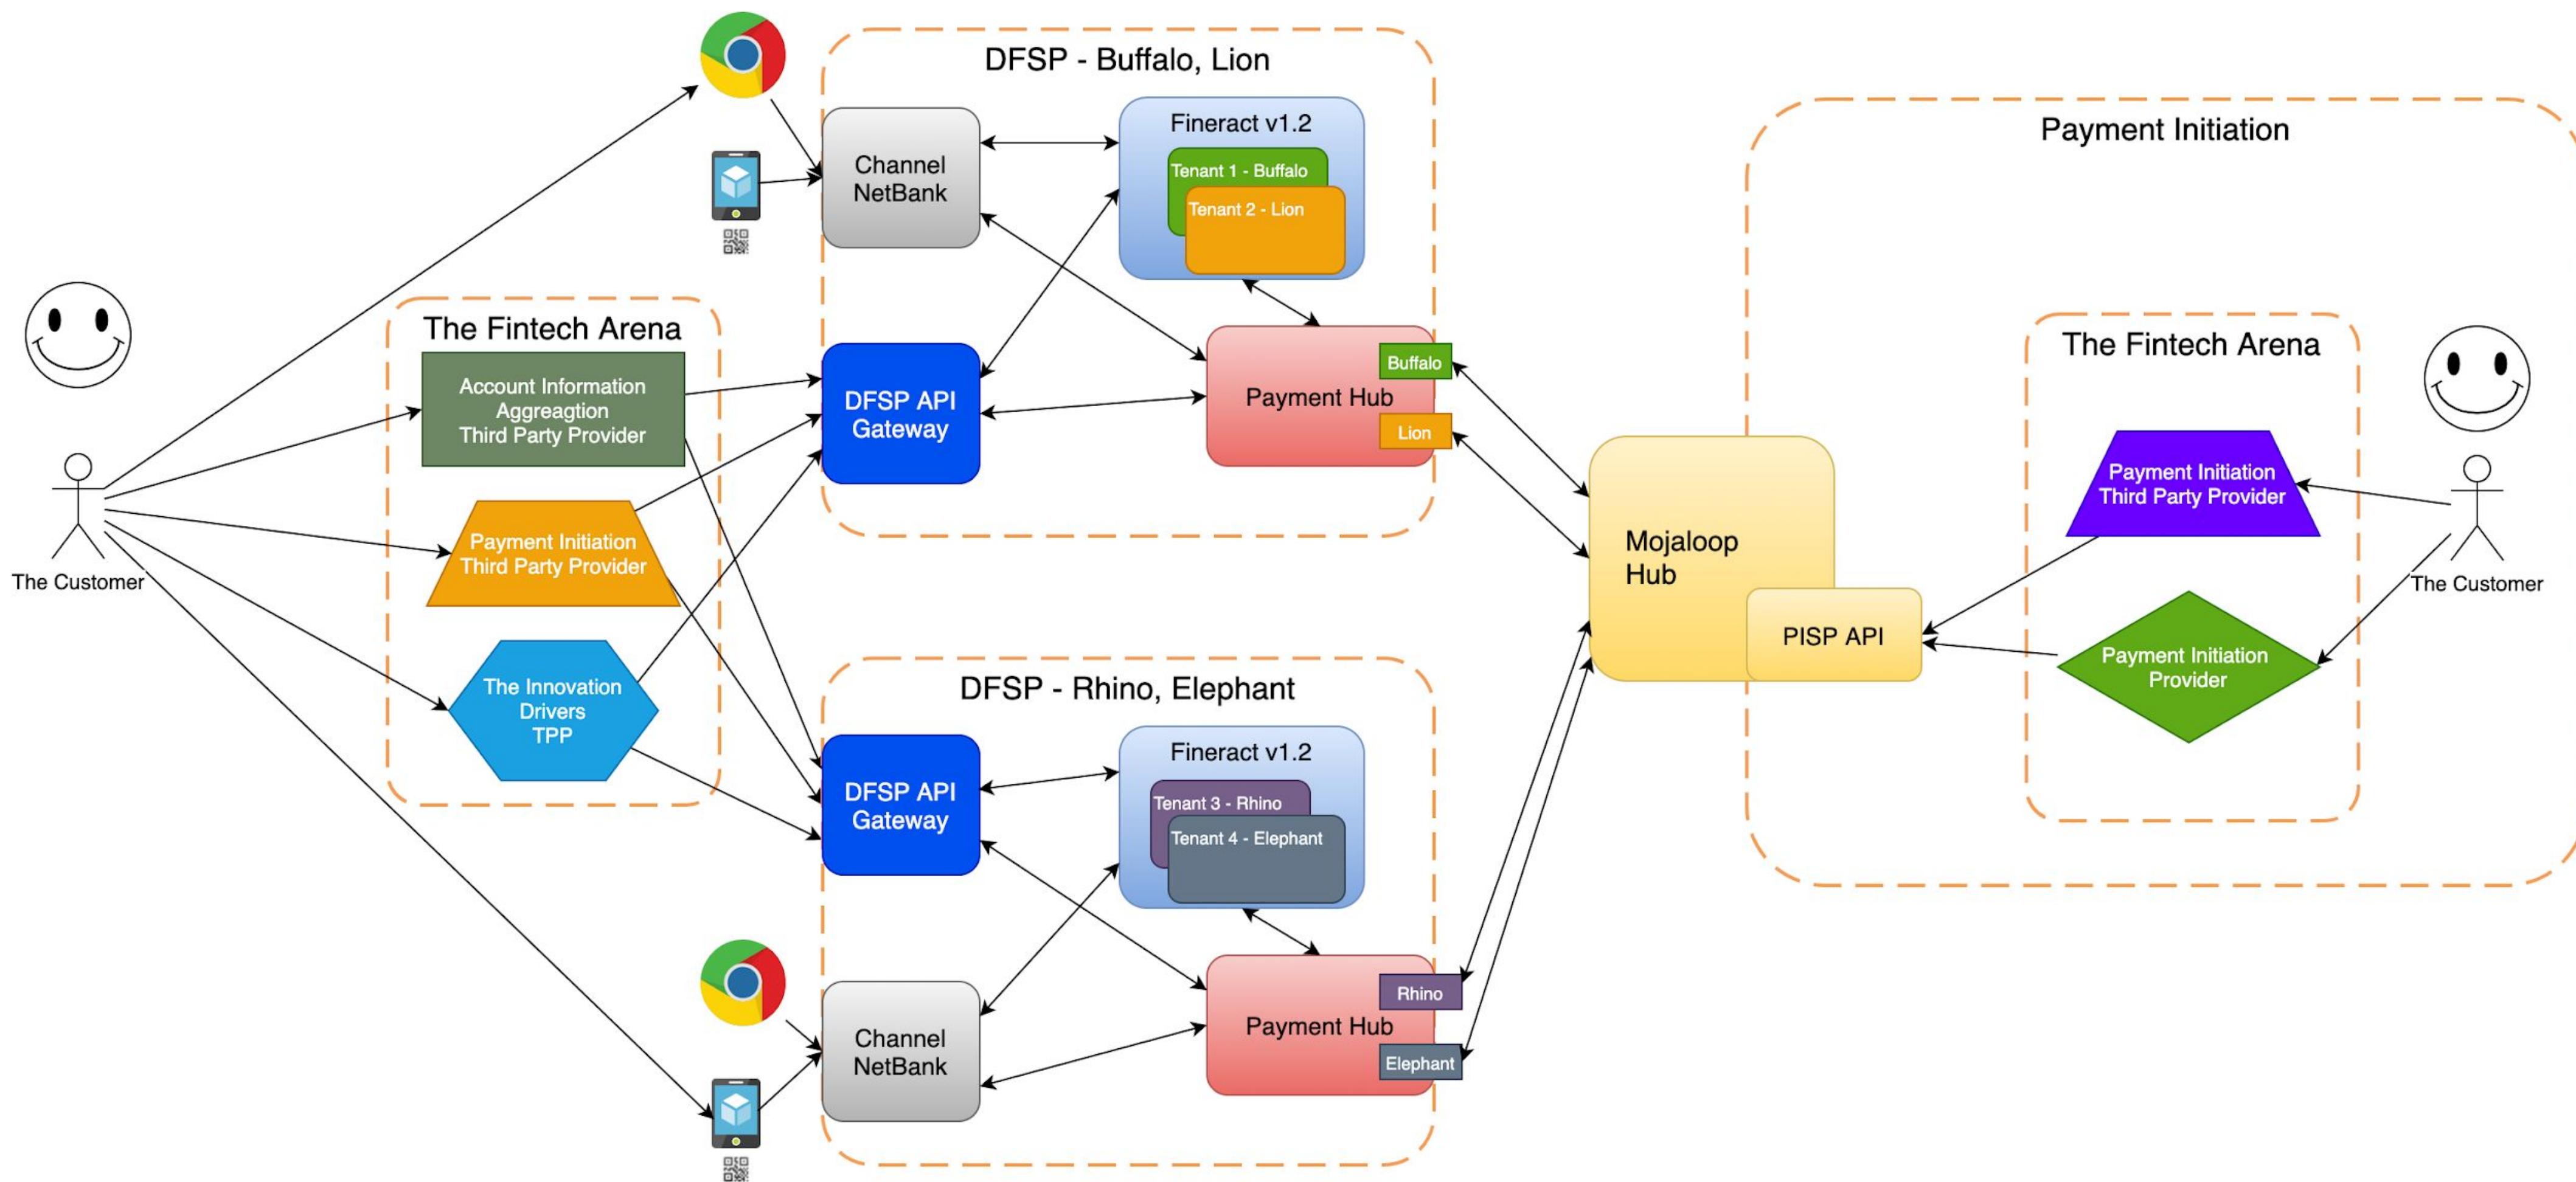

# Addressing an account

- How to address the ultimate payee in a structured way in the Mojaloop transfer message structure?
- ISO20022 has terms Creditor and UltimateCreditor
- We used the RemittanceInfo in the pacs.008 message to identify a Mojaloop Account:

```
mjlp:msisdn:27710203999
```

# Providing Openbanking API to Fintechs

- Supporting the Openbanking APIs at DFSP
- Working towards to enable the PISP API implementation

# Roadmap for Payment Hub EE

Continue working on bulk payments and OpenG2P

Continue performance testing and high availability testing

Providing stand-in capability

Reconciliation

Real-time transactions, Mojaloop reports, Corebanking ledger

# Bulk Payment Support

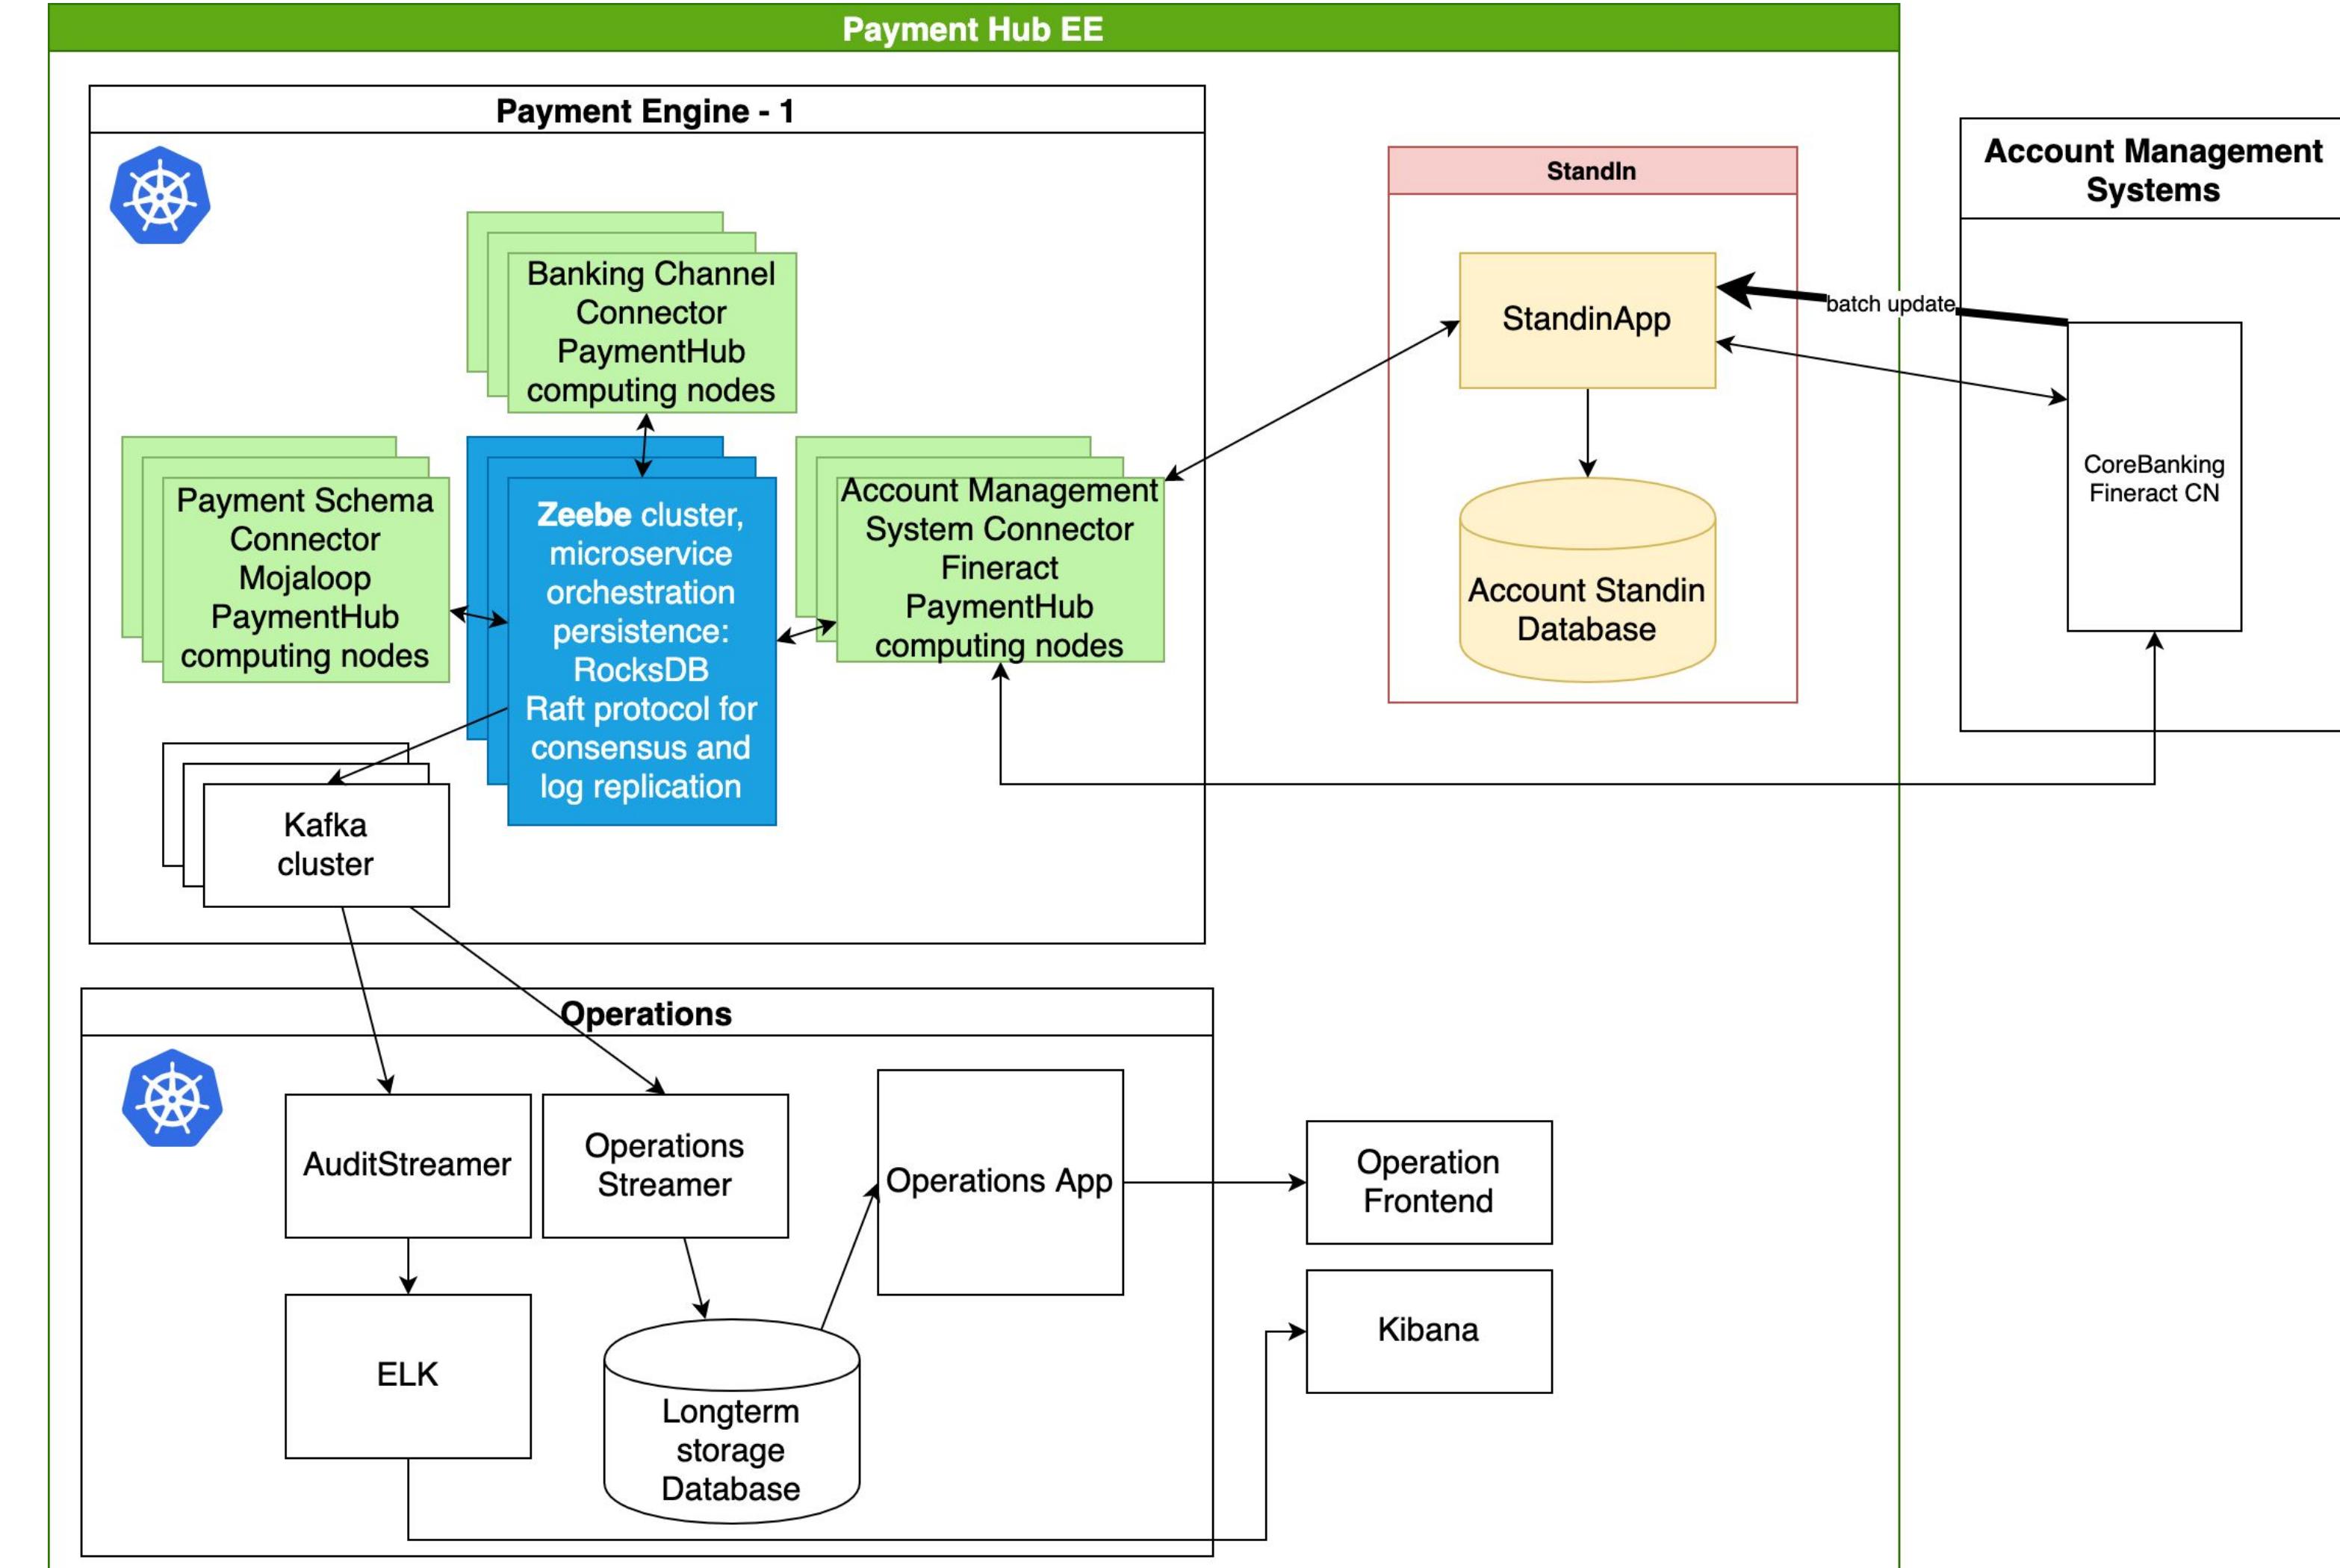

- . Preprocessing bulk payments
  - Lookup Payee's DFSP ID for the transactions to determine target DFSP
  - Splitting the incoming bulk into smaller batches per target DFSP
    - On-us transactions can be handled differently
  - Manage communication with Mojaloop for the batches
  - Aggregate incoming results to provide response to the bank's channel
  - In case transferring from a single account (pension, aid), booking can be individual, aggregated by target DFSP or single grand total

# Stand-in

Integrated into the Payment Hub EE solution a stand-in system could provide functionality in case the Account Management System is not available.

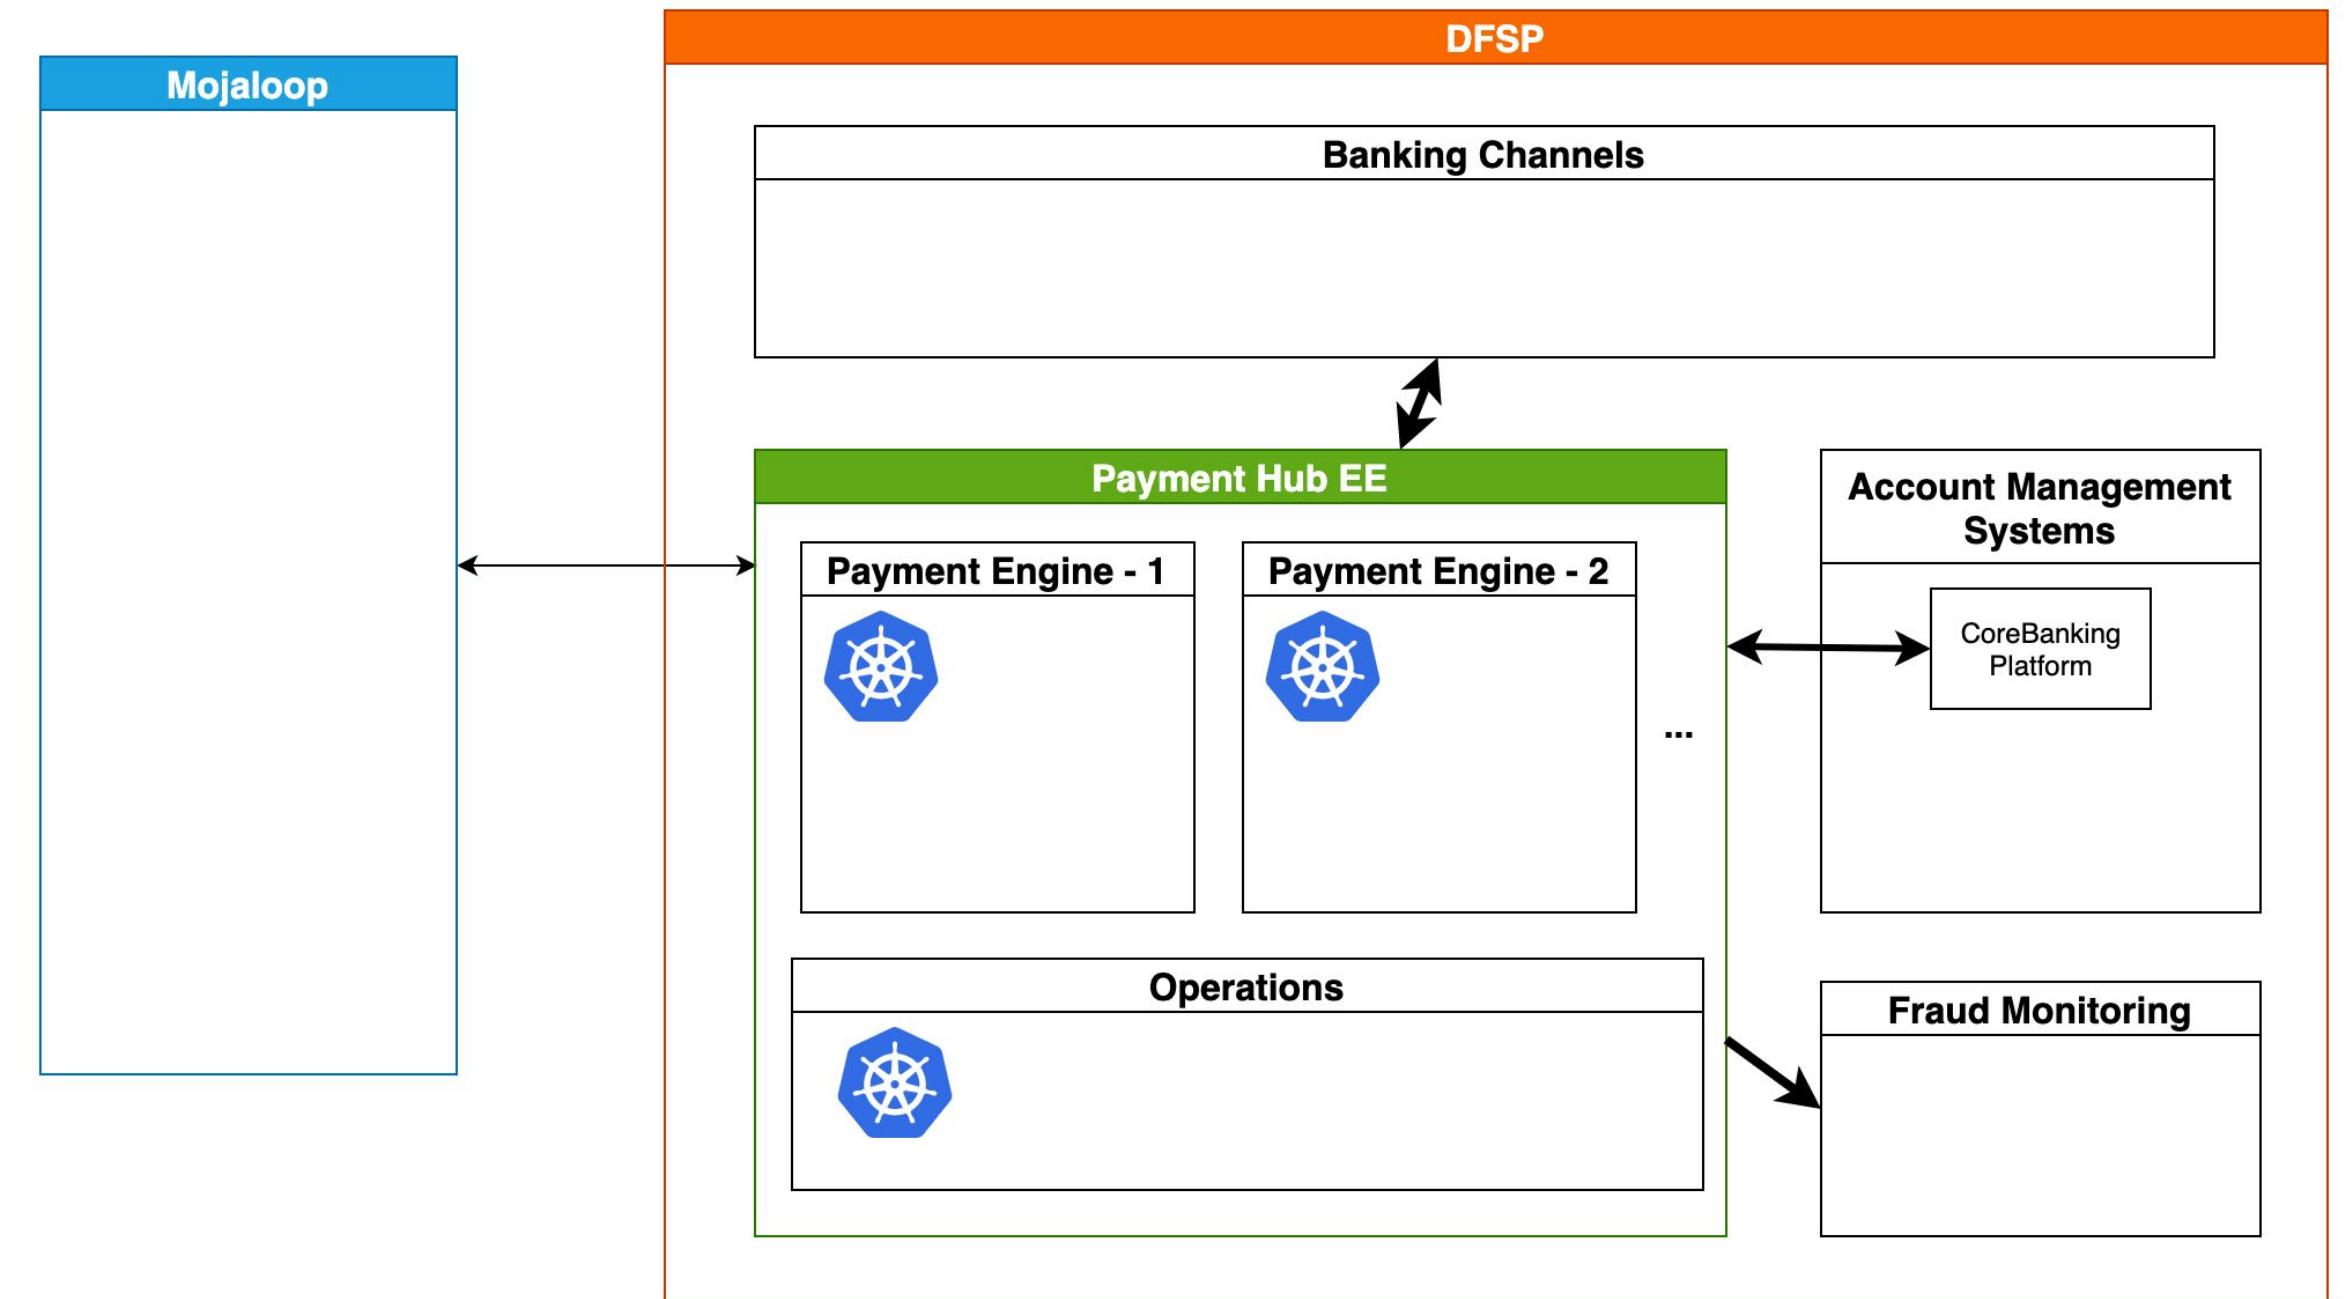

MFI's systems are often not 24x7.

- only incoming transactions - simple solution, requires only synchronizing the valid account and party ids
- both incoming and outgoing transactions - requires more complex solution to minimize risk of overdraft

# DFSP Level Fraud Detection - Regulatory Fraud Detection

- The payment process could support the DFSP level Fraud monitoring tools
  - to stop transactions or alert operators
- There are requirements to keep the on-us transactions inside the DFSP
- PHEE can be the component to provide information to regulators with the required amount of granularity of on-us transaction details (considering GDPR and similar regulations)
  - send all transactional information as individual reporting messages
  - aggregate on-us traffic data for a required period (minutes to days)

# Backup Slides

# Deployment models

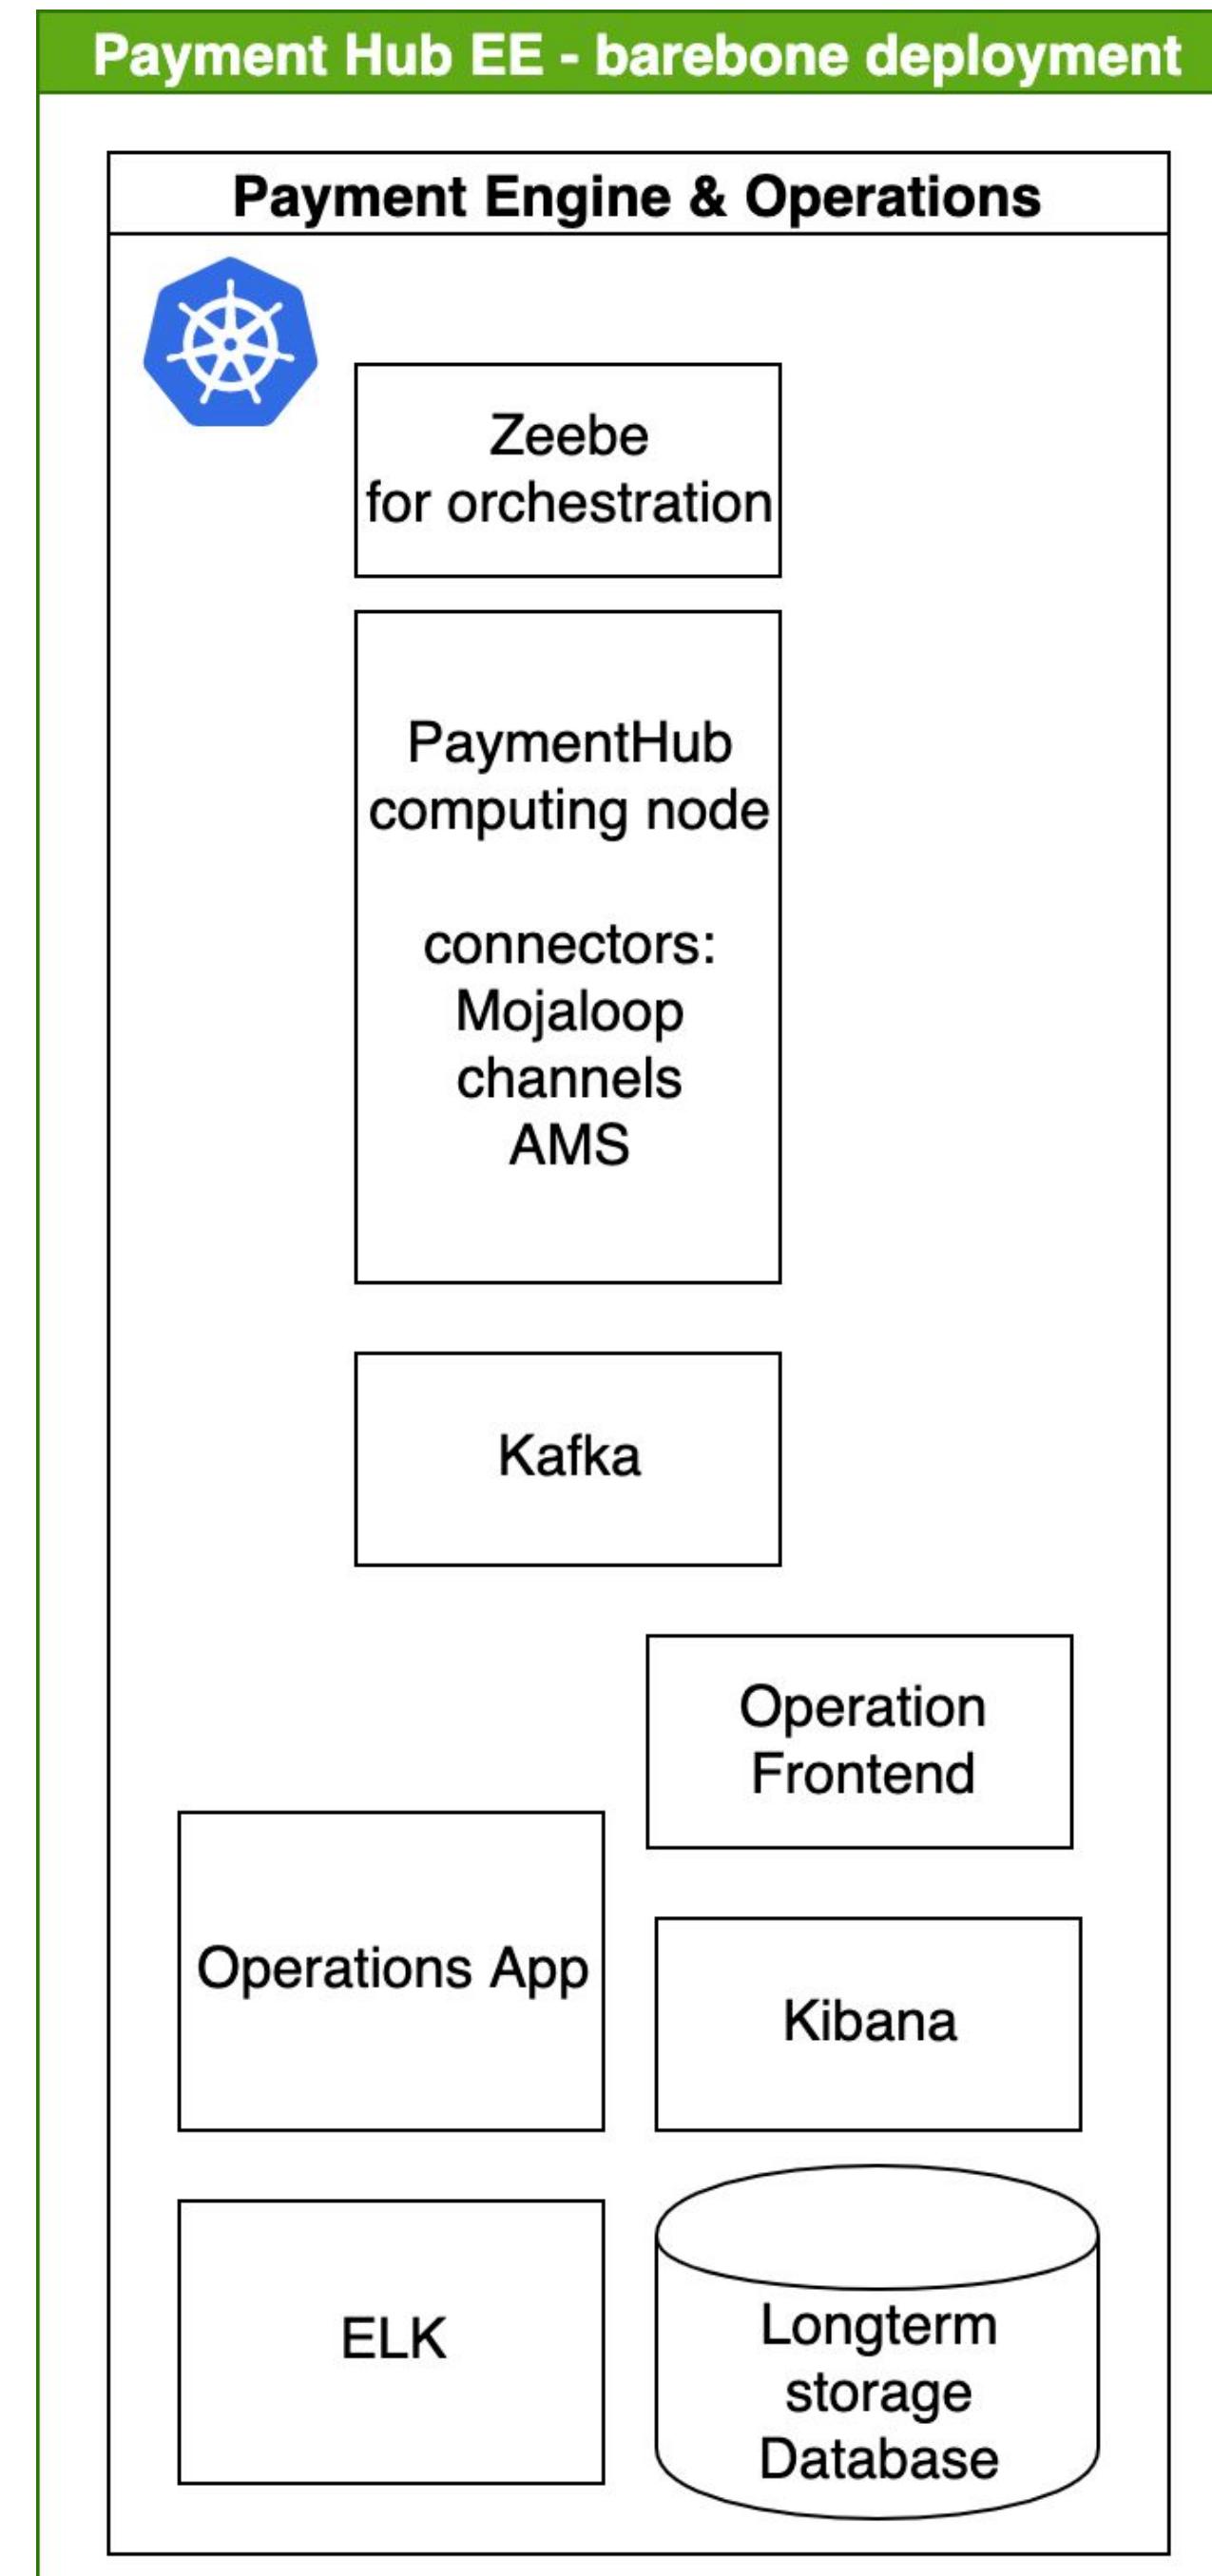

On-premises and any of the cloud providers

Shared service serving multiple DFSPs run by an aggregator (multiple SACCOs, credit unions on a multitenant setup) or dedicated setup

Depending on the DFSP requirements it could be deployed as

- **barebone** - single instance of components, minimized resource usage, no loss of functionality
  - Might not run on a feature phone, but we will get there.
- **medium** - single realtime engine
- **fully scaled** - multiple realtime engines

The difference is in availability, fault tolerance and the volume of transactions, which can be handled.

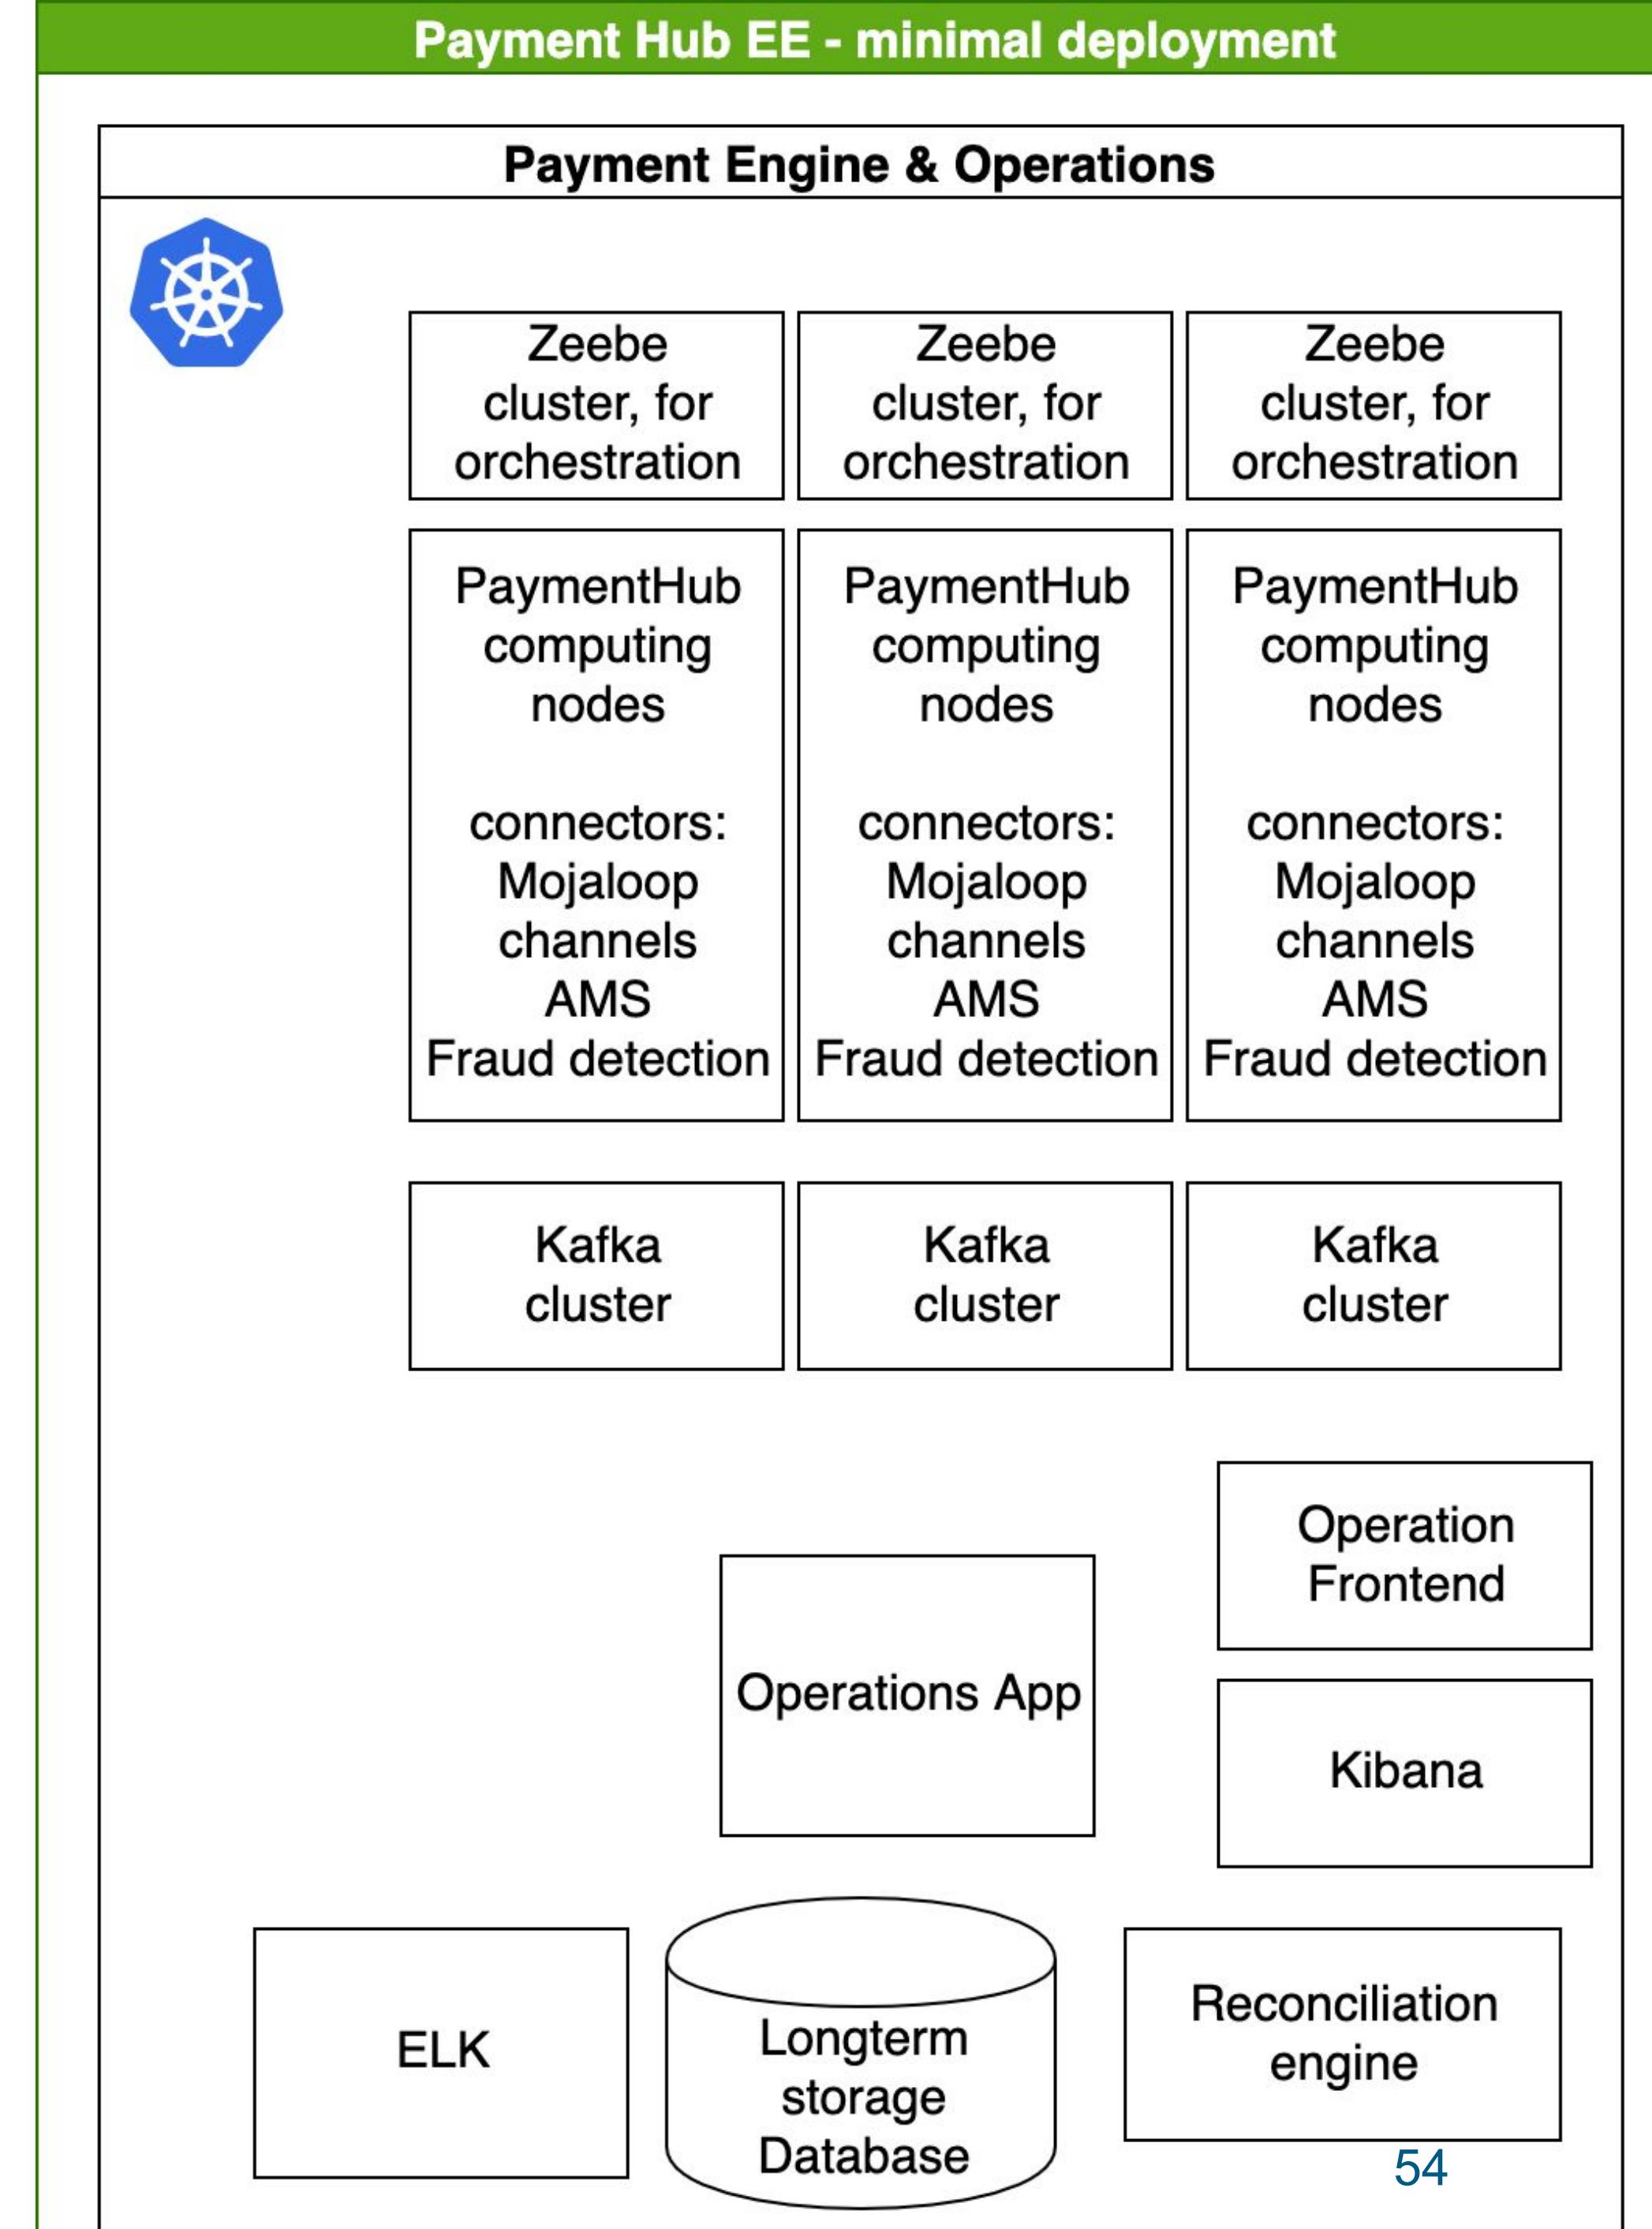

# Deployment model - medium

## Medium deployment

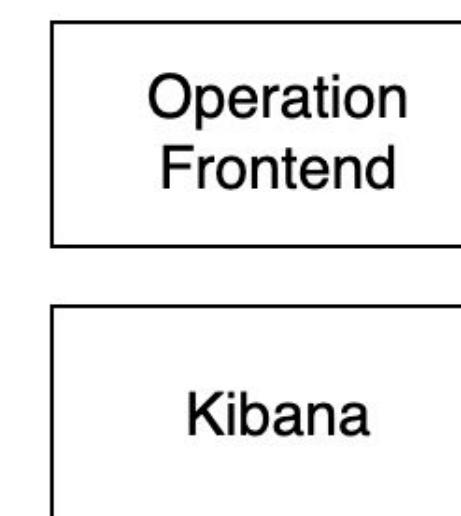

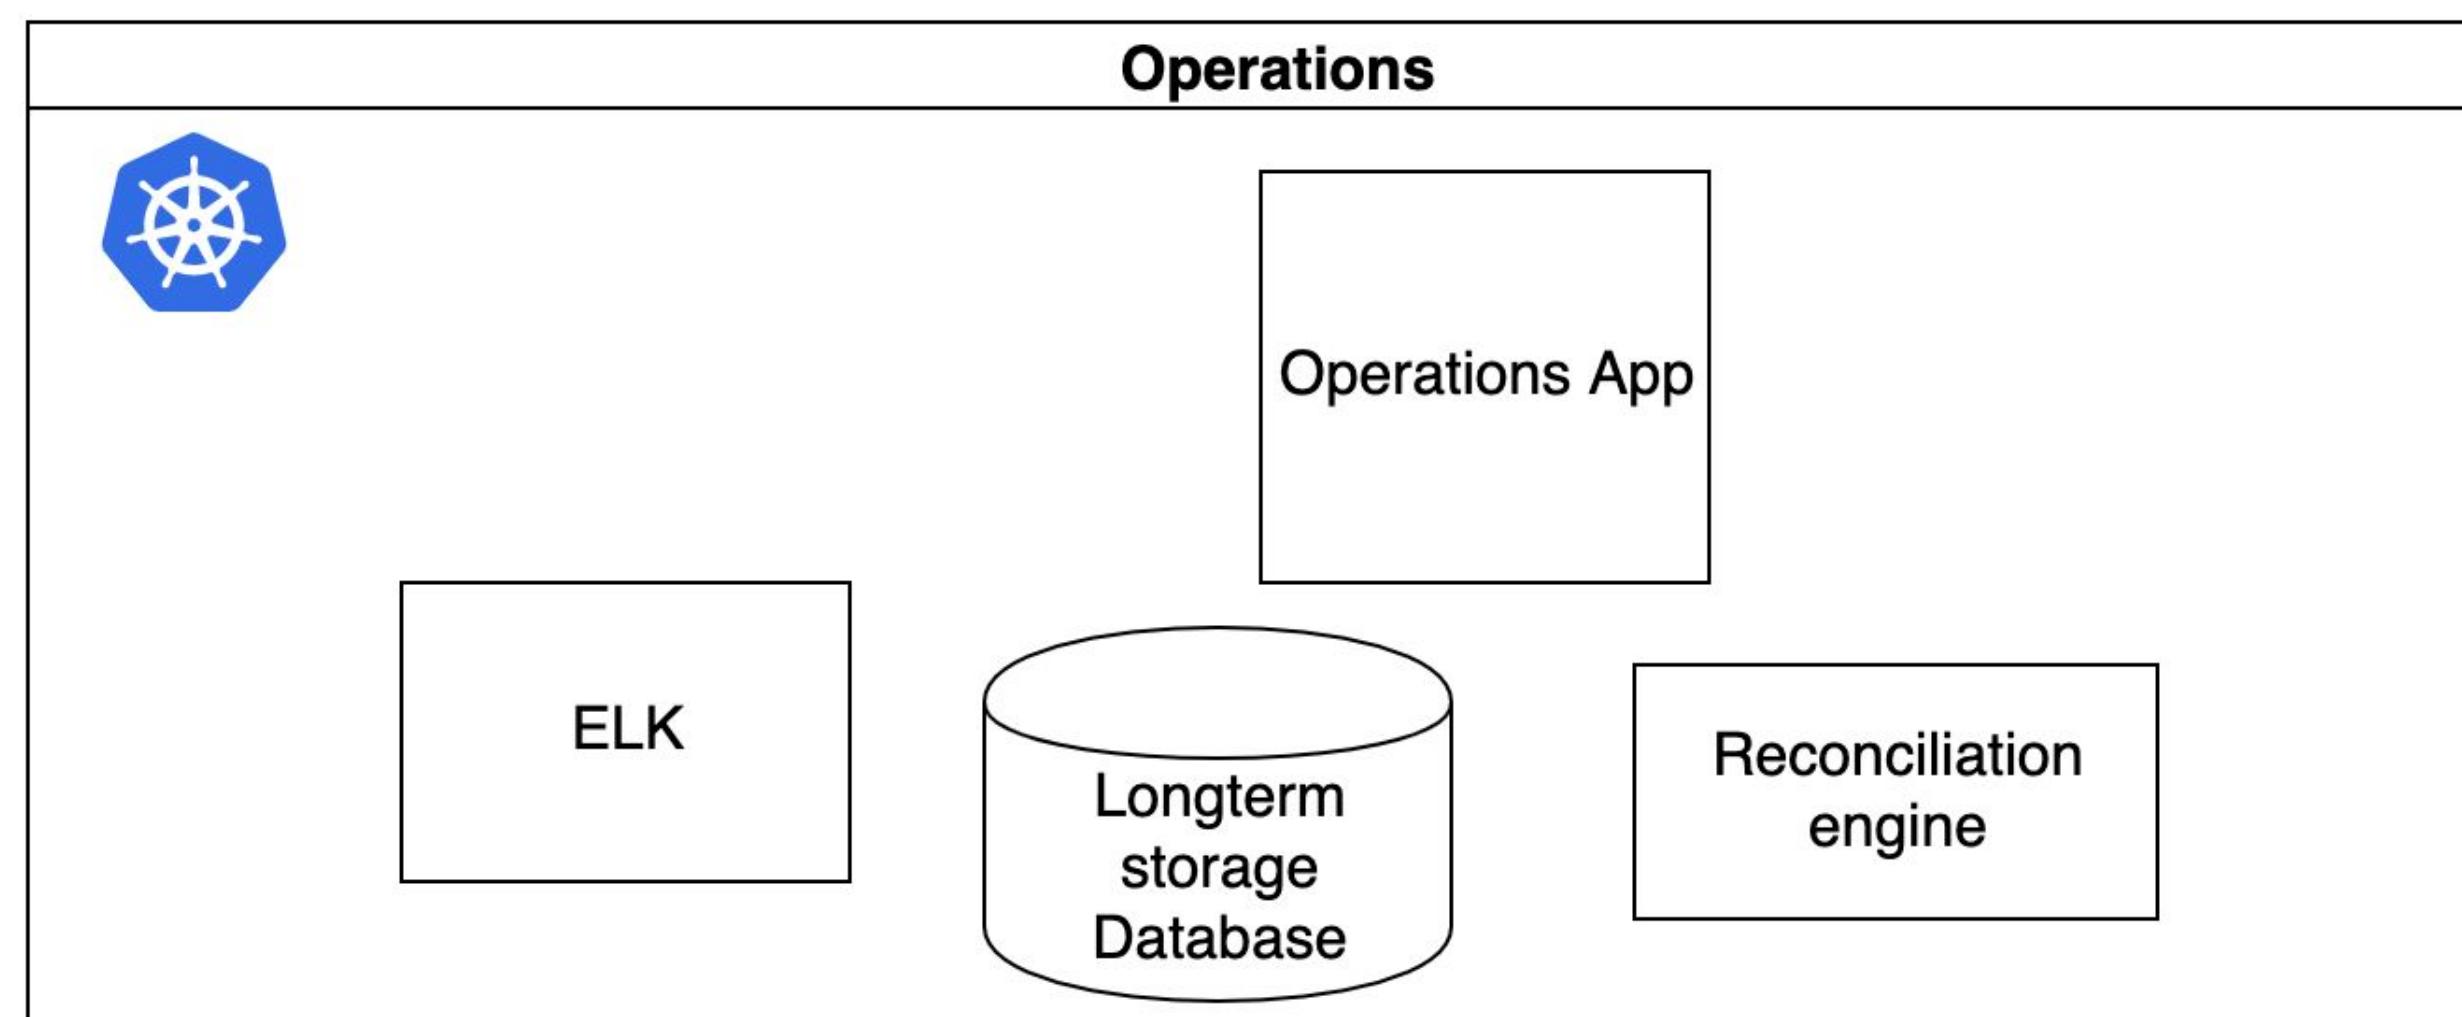

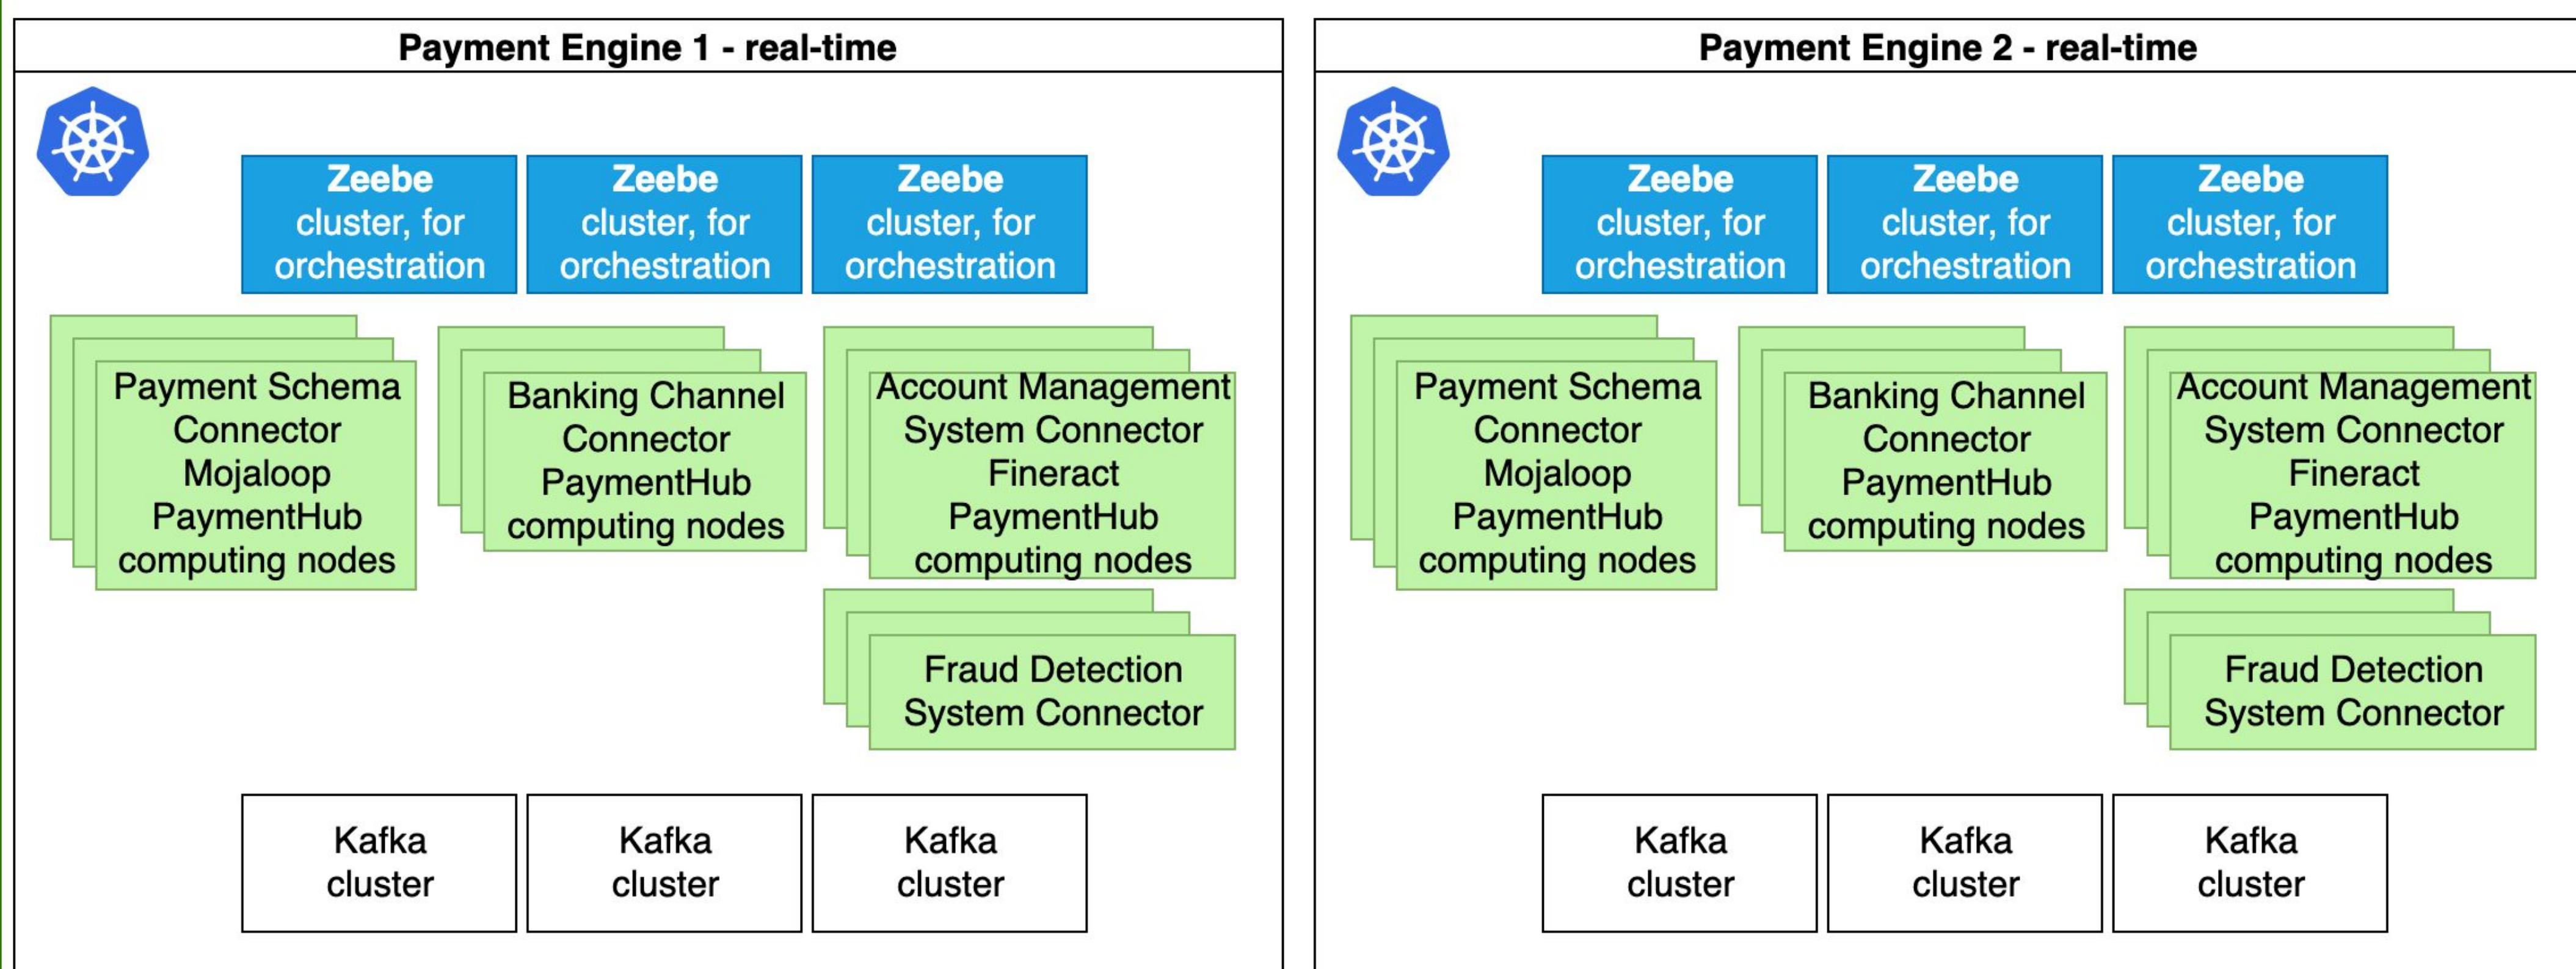

- Single kubernetes cluster to contain all the necessary components
- Fault tolerance provided by the clustered components
- Stretched installation across data centers possible, but not ideal

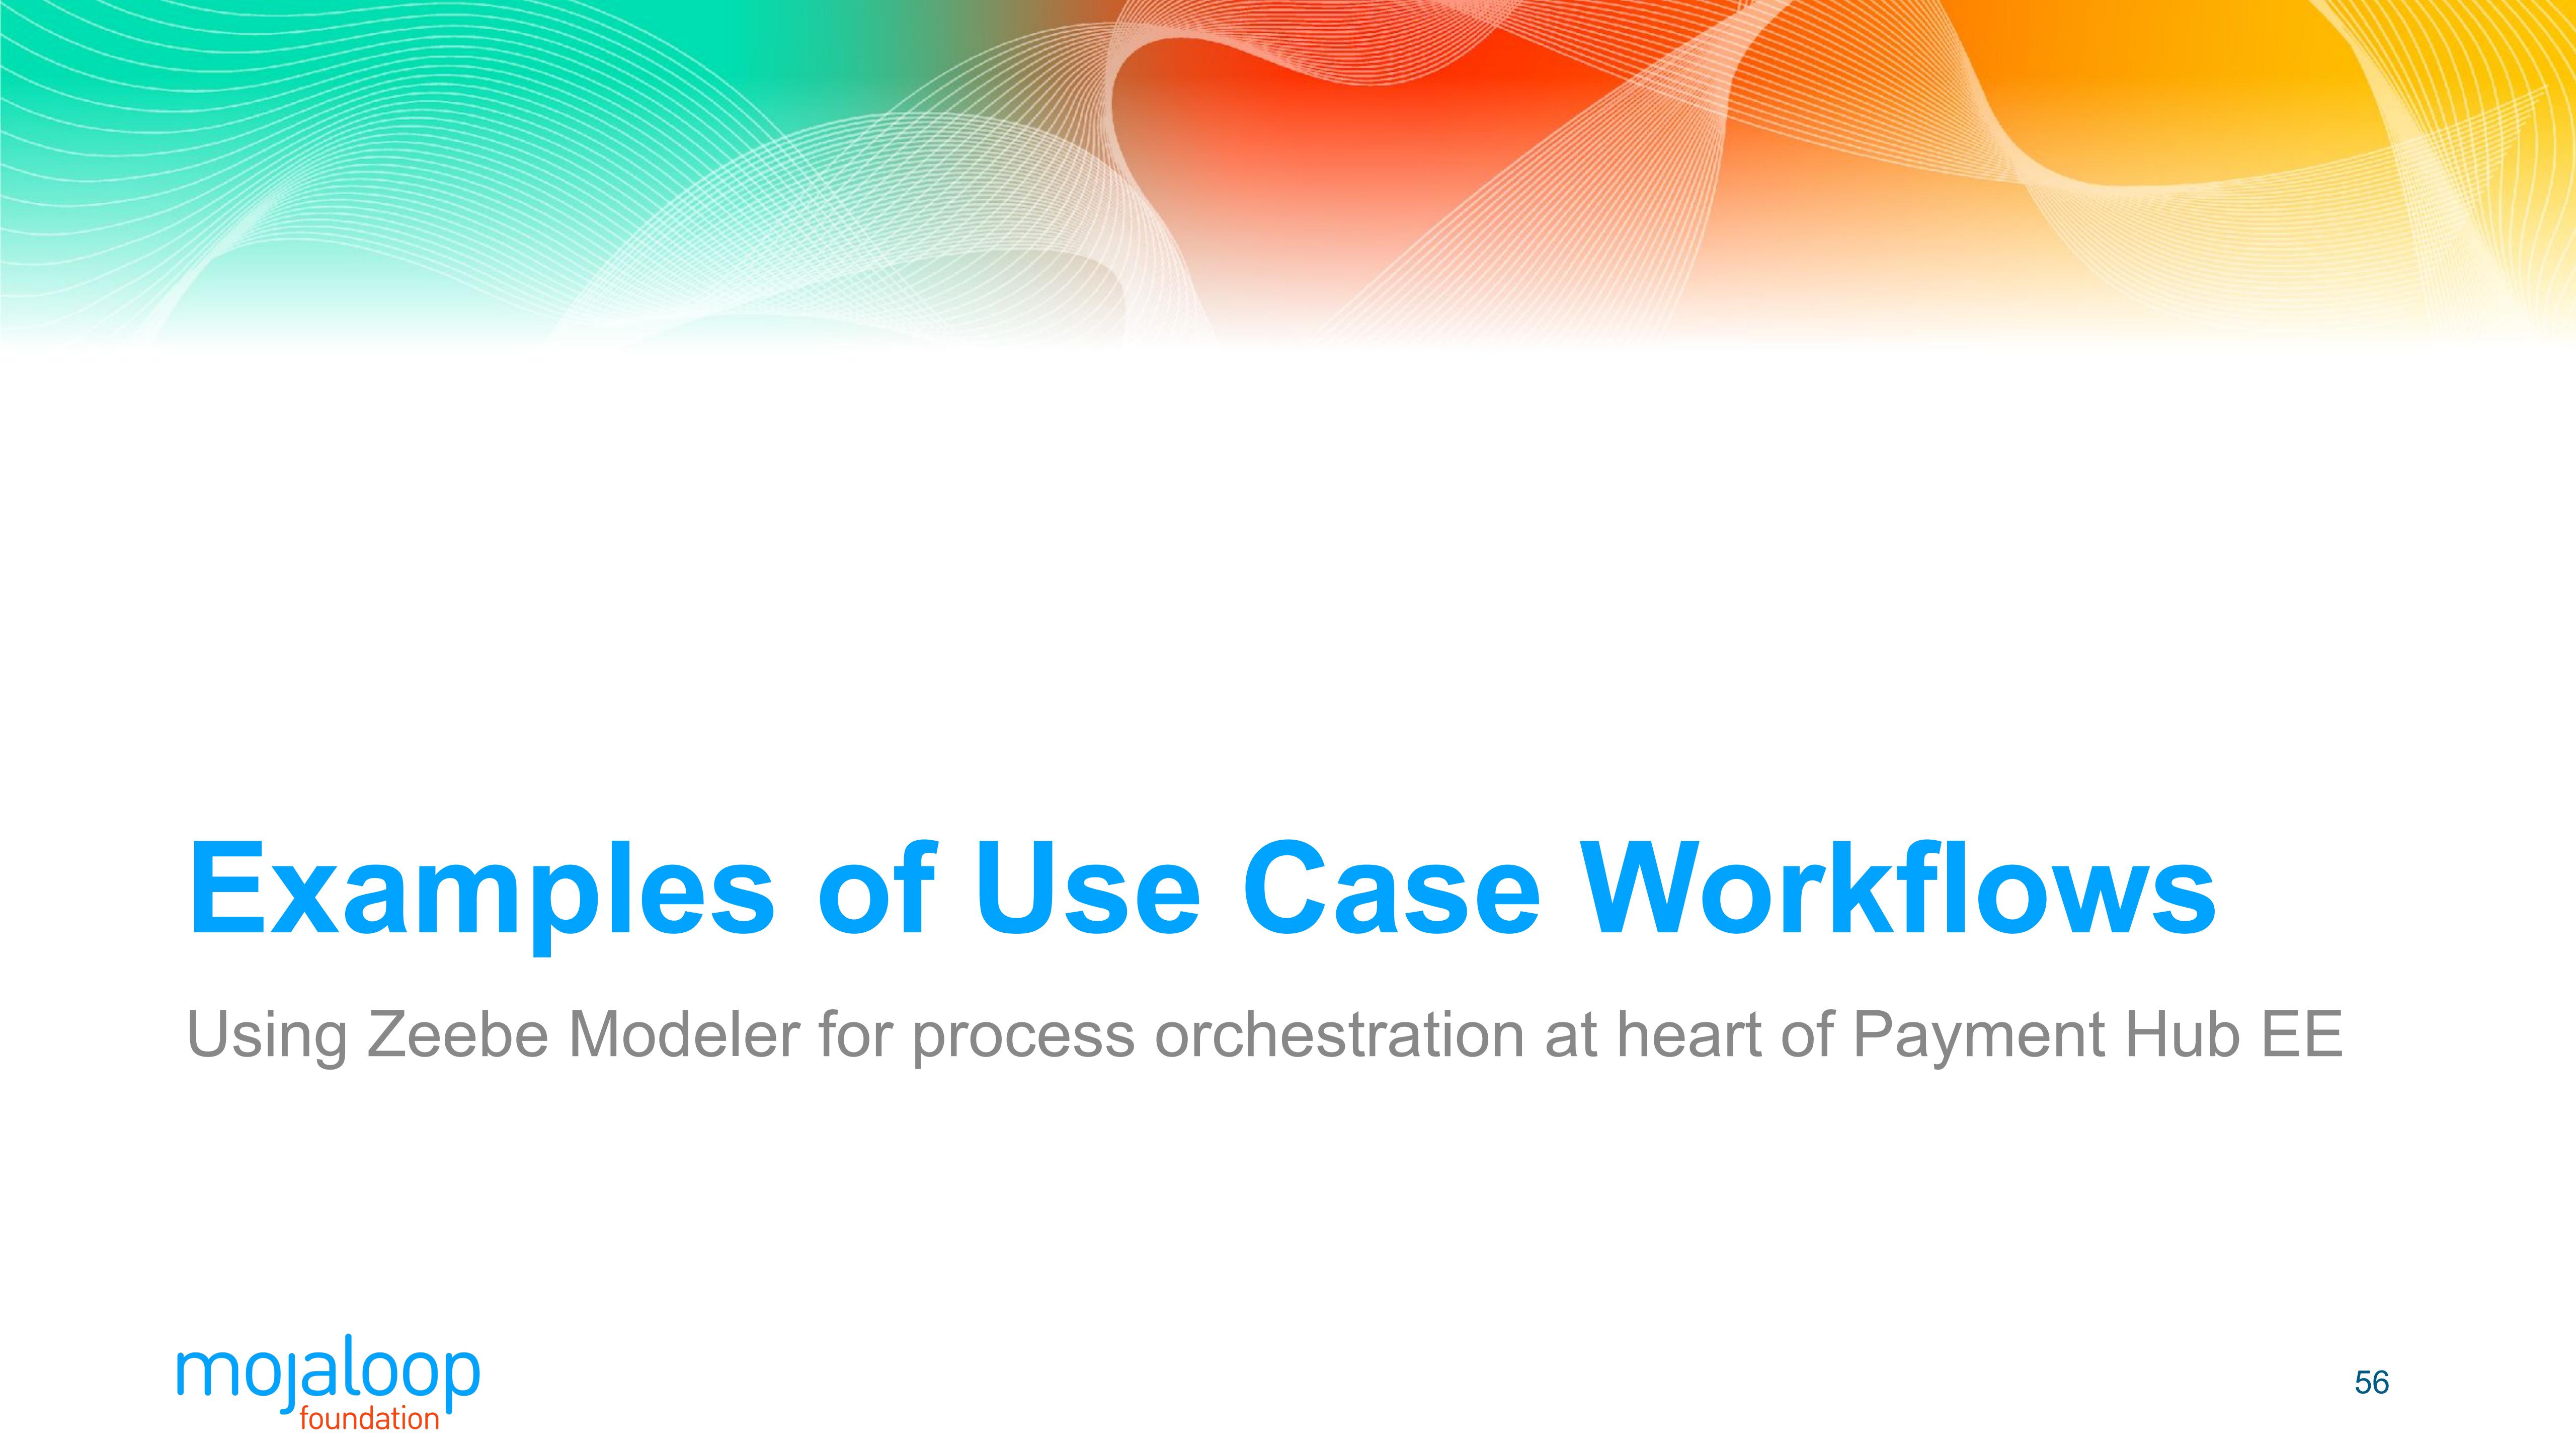

## Full scale deployment

- Multiple independent payment engines (a single engine is collocated for performance), enabling complete version upgrades without service interruptions
- Running in different data centers on independent network connections (high availability, fault tolerant even in case of disaster scenarios)
- Partitioning the load across the engines

# Payment Hub EE

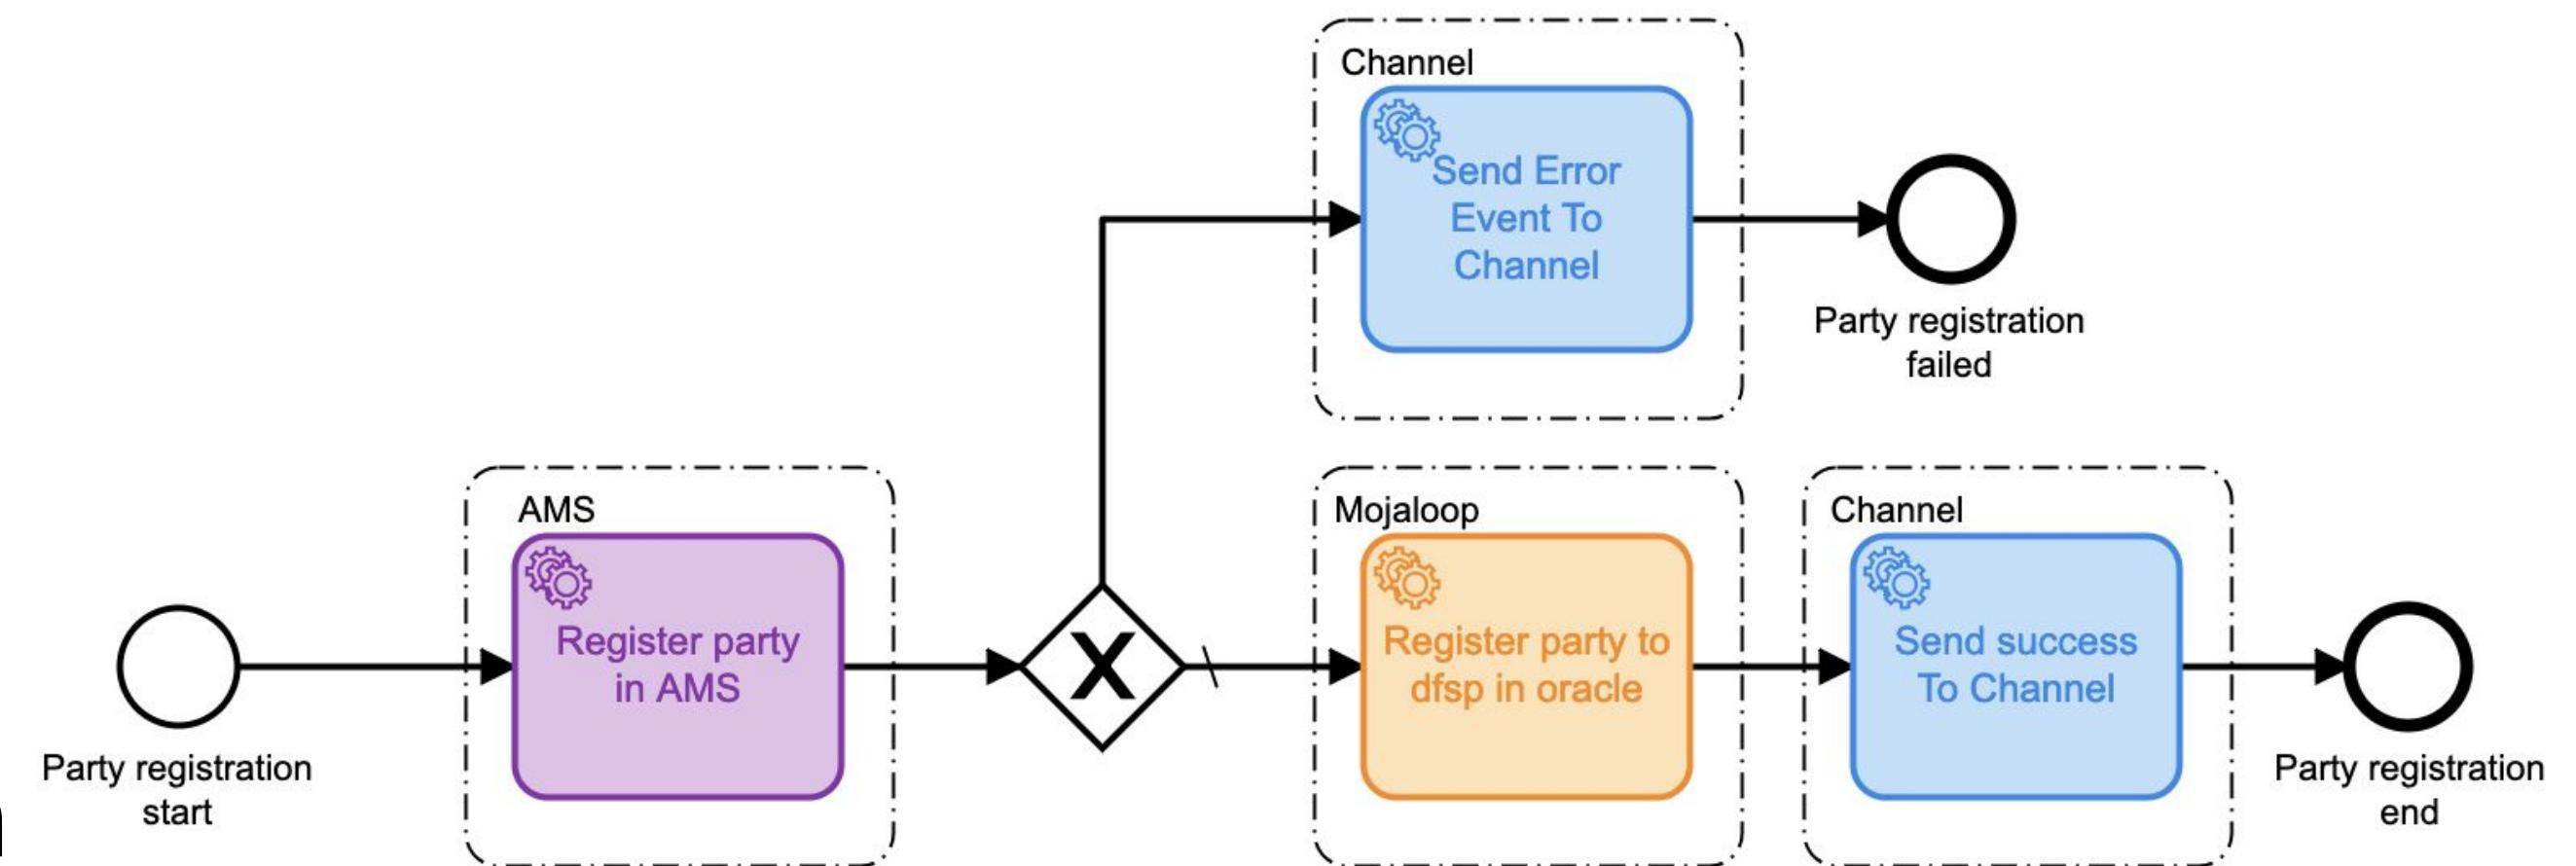

# Examples of Use Case Workflows

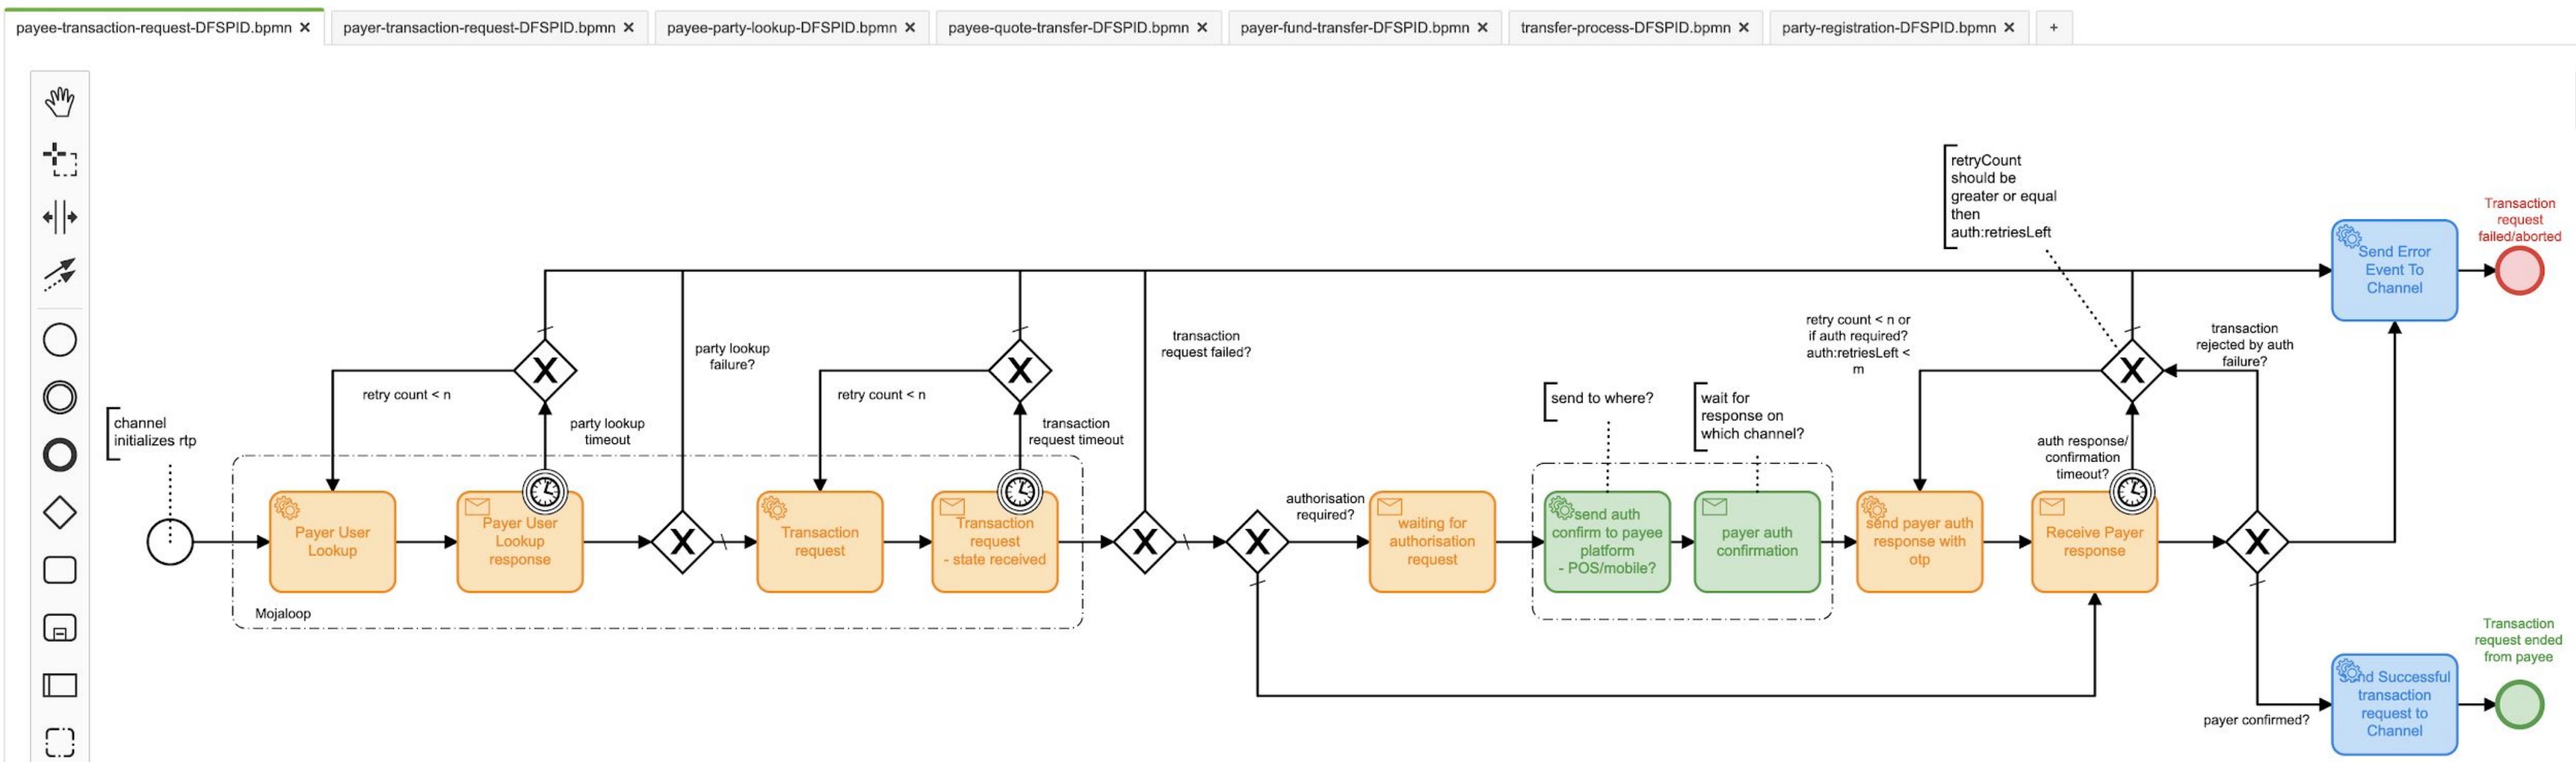

Using Zeebe Modeler for process orchestration at heart of Payment Hub EE

# Party Identifier Registration

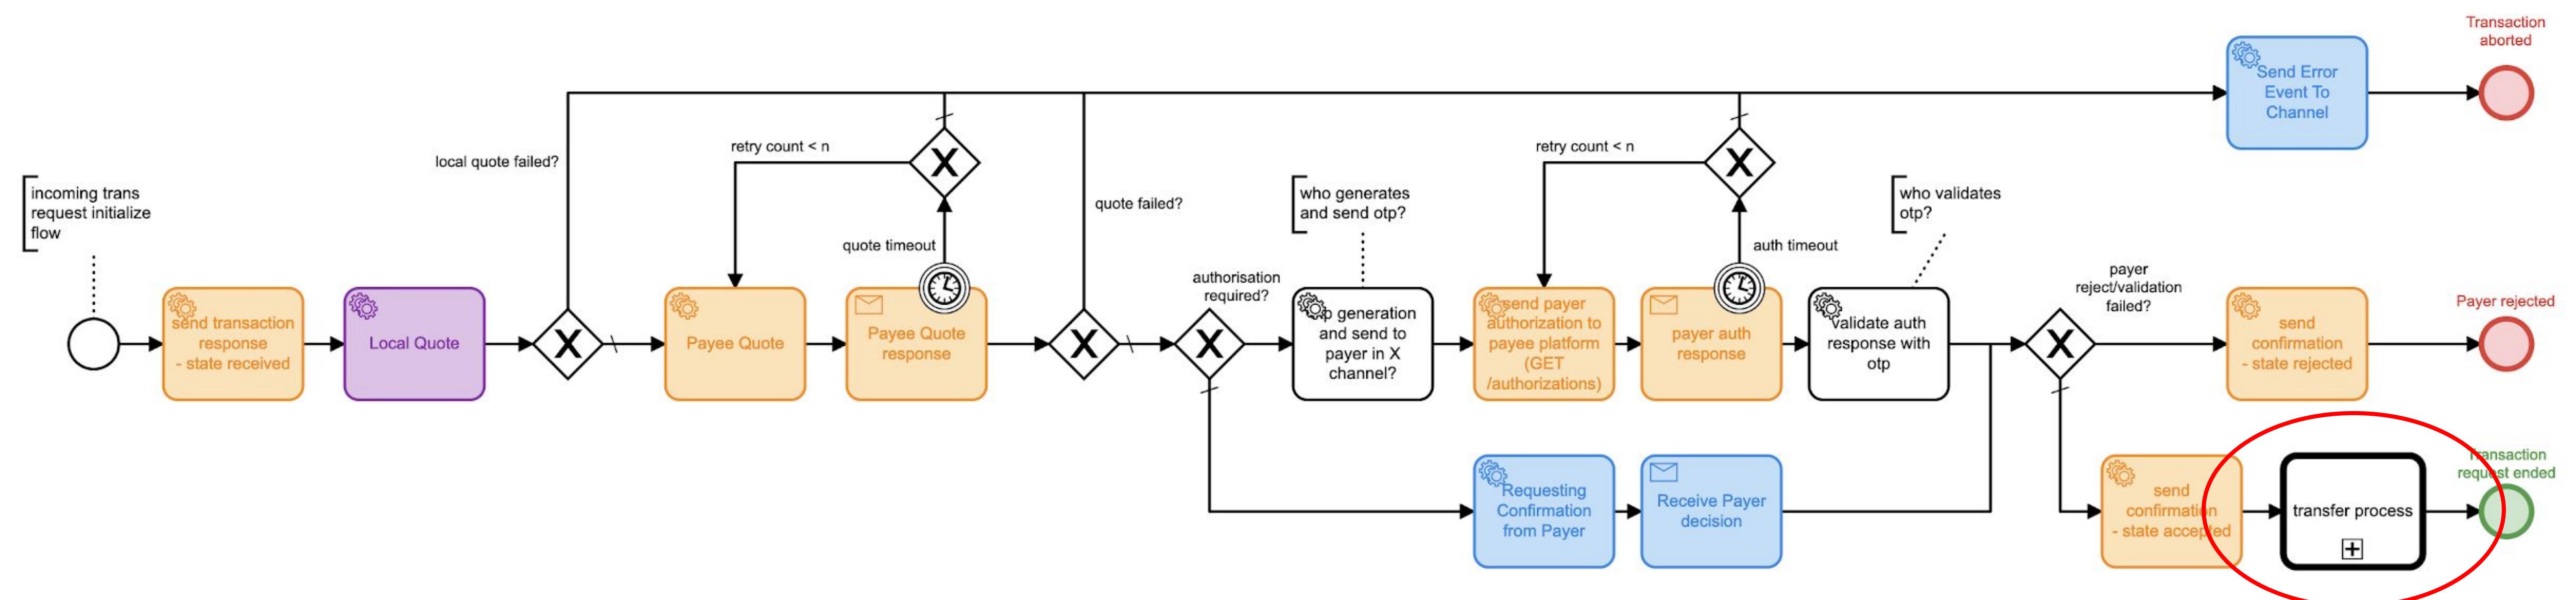

- Initiate the association of a party identifier (MSISDN) with an account at DFSP
- Register identifier in the DFSP systems (in the Account Management System in our environment)
- Manage the registration process with error handling at the “Oracle”

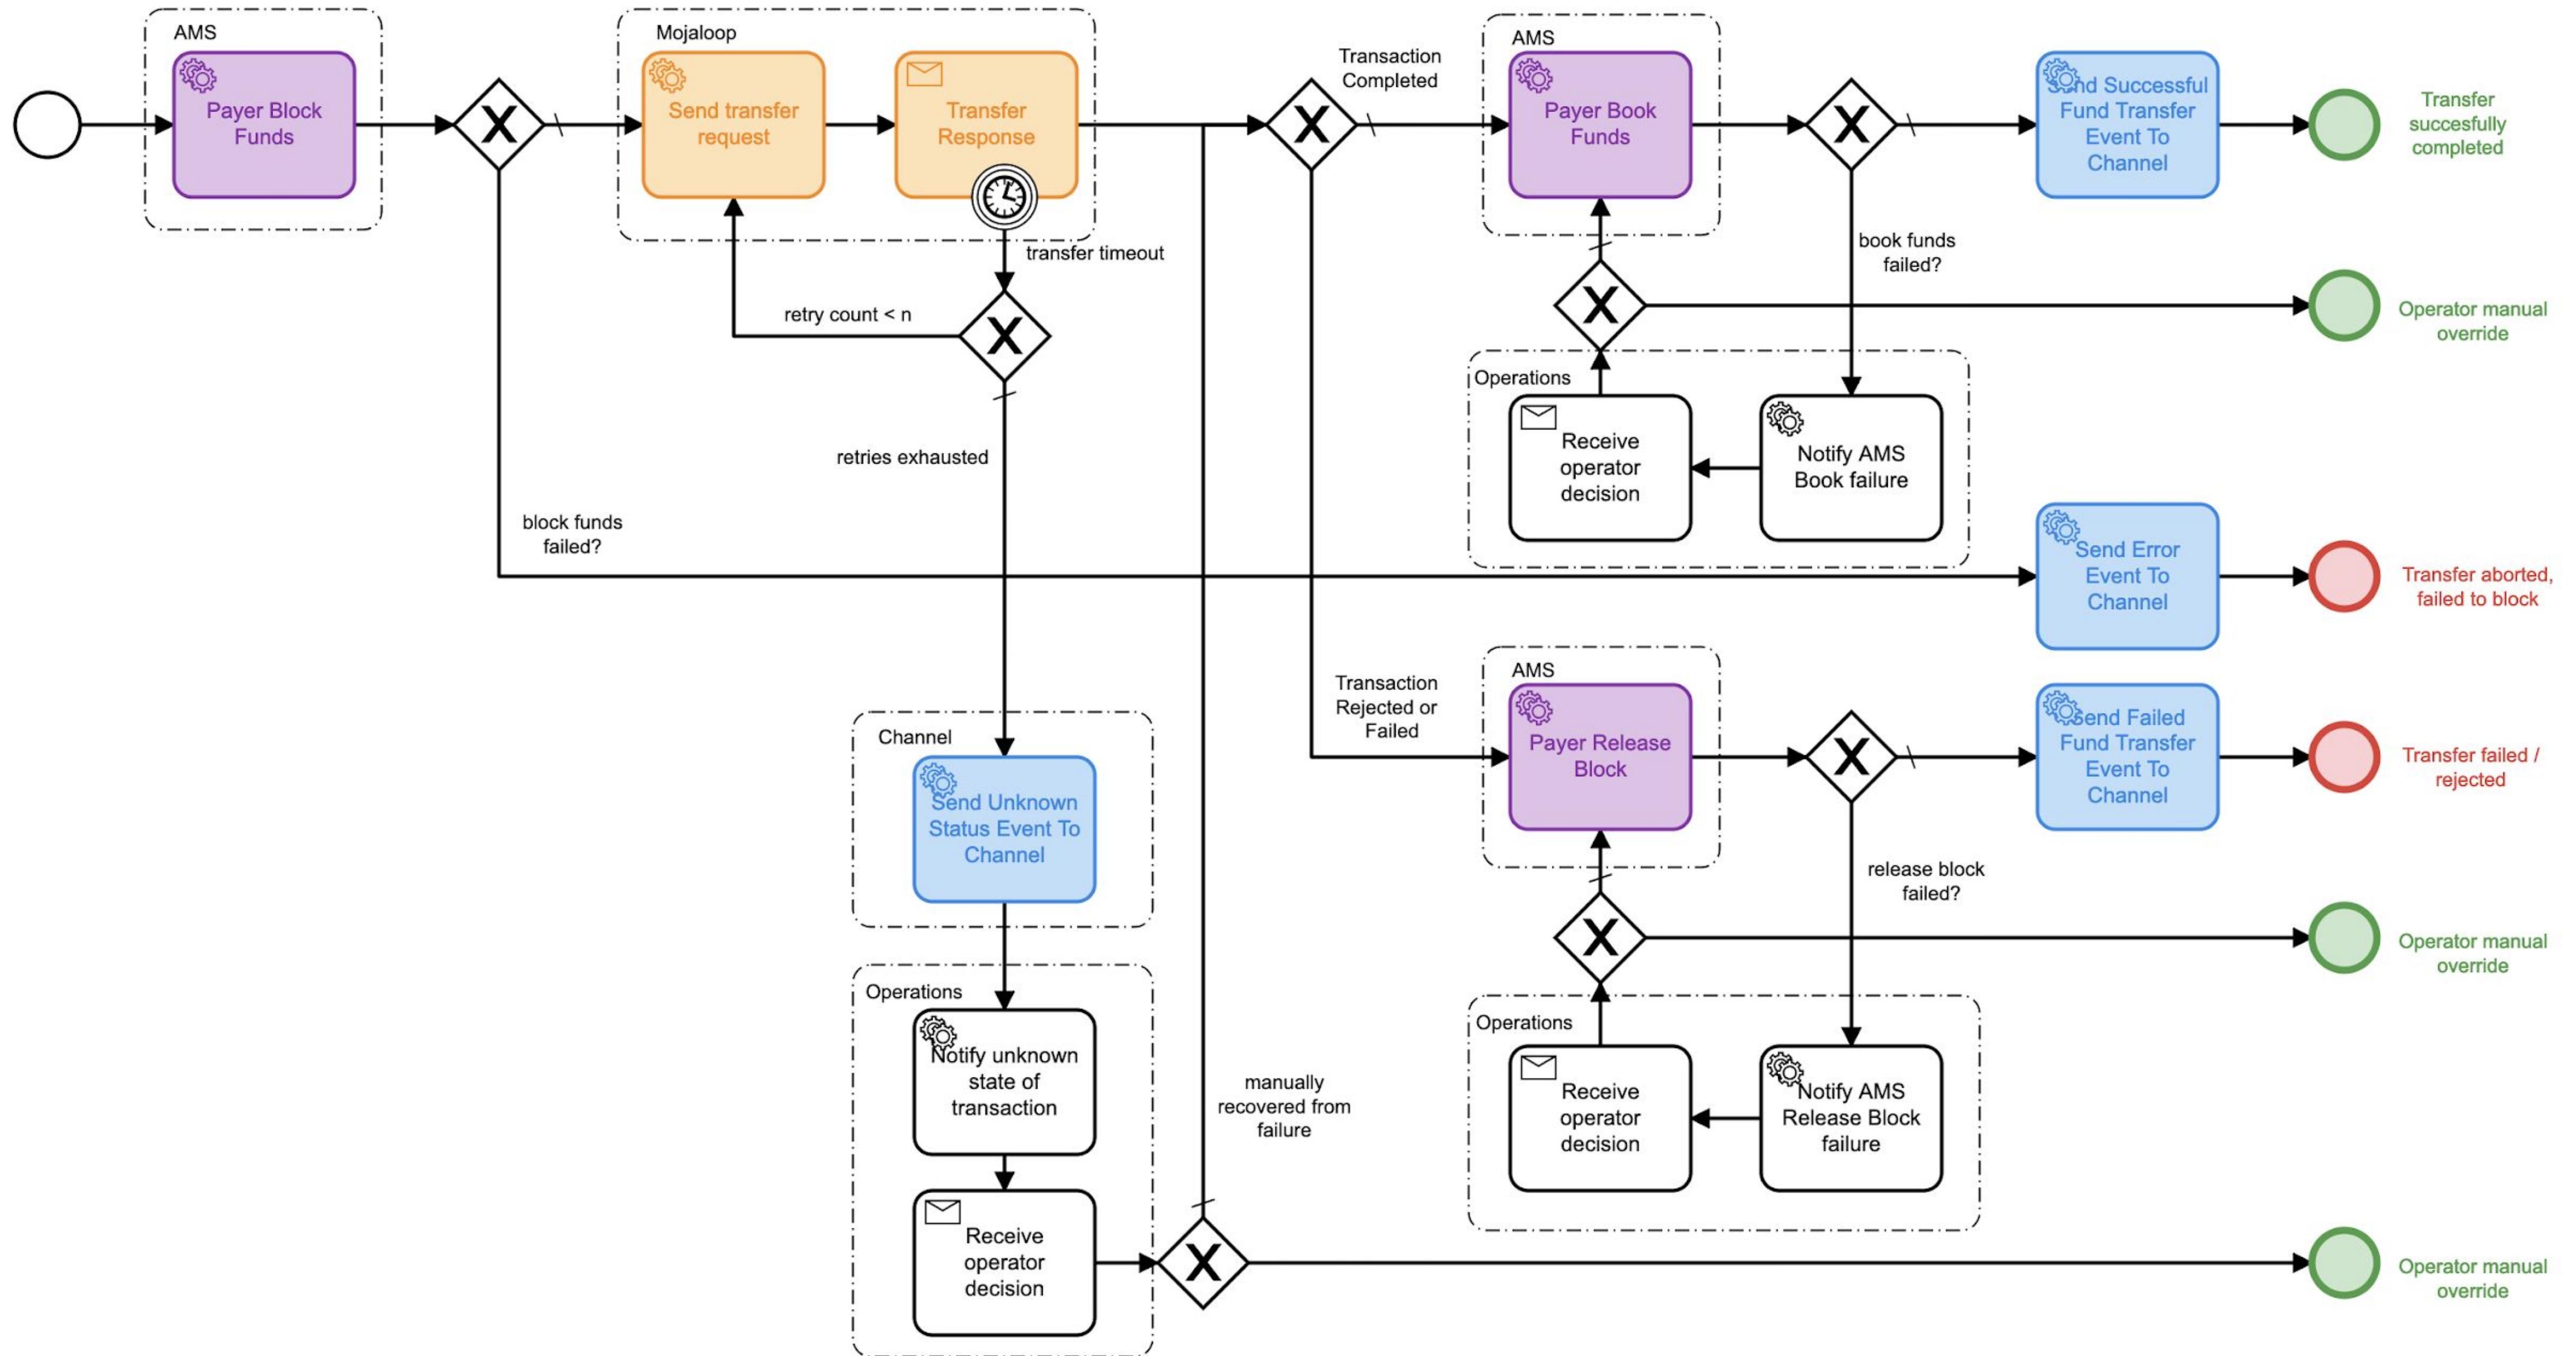

# Payee Initiated flows - Request To Pay

# Accepting request to pay at Payer

# Payer Fund Transfer

# Operational Control Center for DFSP actions

Authentication and authorization with privileges for different actions

Complete segregation of tenants, separate databases and users

Search and detailed view of transactions

Refund capability for privileged operators on successful incoming transfers

After multiple automated attempts, transactions can be handed over to operations to retry or resolve manually

# Search capability for the different flows

The screenshot shows the Mojaloop Payment Hub EE interface. At the top, there is a blue header bar with the following elements from left to right: a green and blue square icon, a back arrow, a 'Payment Hub EE' logo, an 'Admin' icon, a magnifying glass icon for search, a 'Language en-US' dropdown, a gear icon, a bell icon, and a user profile icon.

The main content area has a white background. On the left, there is a sidebar with a house icon. The main area displays the following search options:

- Search Incoming Transactions**  
Advanced search option for incoming transactions
- Search Outgoing Transactions**  
Advanced search option for outgoing transactions
- Search Incoming Request to Pay**  
Advanced search option for incoming request to pays
- Search Outgoing Request to Pay**  
Advanced search option for outgoing request to pays

# Incoming Payment at Payee

The screenshot shows the Mojaloop Payment Hub EE interface for managing incoming payments. At the top, there's a navigation bar with a logo, a back arrow, 'Payment Hub EE', 'Admin' settings, a search icon, language selection ('en-US'), and user notifications.

The main area is titled 'Incoming Transactions' and includes a breadcrumb trail: Home / Payment Hub EE / Incoming Transactions. There are several filter inputs: Payer Id, Payer DFSP Id, Payer DFSP name, Payee Id, Transaction ID, Status (dropdown), Amount, Currency, Transaction Date From, and Transaction Date To.

A table below lists the details of two incoming transactions:

Start Time (UTC)	Completed Time (UTC)	Transaction ID	Payer Id	Payee Id	Payer DFSP Id	Payer DFSP Name	Amount	Currency	Status
2020-07-22 10:54:07	2020-07-22 10:54:15	58f4aea5-8cc4...	27710306999	27710101999	in03tn06	Gorilla Bank	215	TZS	COMPLETED
2020-07-22 08:32:59	2020-07-22 08:33:07	0f9bd223-d91f...	27710306999	27710101999	in03tn06	Gorilla Bank	117	TZS	COMPLETED

# Incoming transfers with Refund capability

The screenshot shows the Payment Hub EE interface for an incoming transaction. The top navigation bar includes a logo, 'Payment Hub EE', 'Admin' status, a search icon, language selection ('en-US'), and user icons.

The URL in the browser is [2251799814249533](#) | Home / Payment Hub EE / Incoming Transactions / 2251799814249533

Key components of the page:

- Payer:** MSISDN 27710306999, DFSP Id in03tn06, DFSP Name Gorilla Bank.
- Payee:** MSISDN 27710101999, DFSP Id in01tn01, DFSP Name Buffalo Bank.
- Transfer:** Transfer Code 58f4aea5-8cc4-404f-98ee-191ef1fc02b9, Amount 215 TZS, Completed 2020-07-22 10:54:15, Status COMPLETED.
- Fees:** Payer quote code, Payer fee, Payee quote code d2f05505-beb0-4a7f-91df-92fb2e99368b, Payee fee 0 TZS.
- Action Buttons:** Refund (circled in red), BPMN Diagram.

# Outgoing Transfer - The Refund

The screenshot shows the Mojaloop Payment Hub EE interface. At the top, there is a navigation bar with a logo, a back arrow, the text "Payment Hub EE", an "Admin" icon, a search icon, language settings ("Language en-US"), and user icons for notifications and profile.

The main title is "Outgoing Transactions" with a breadcrumb trail: Home / Payment Hub EE / Outgoing Transactions. There is also a home icon on the left.

Below the title, there are several filter fields:

- Payer Id
- Payee Id
- Payee DFSP Id
- Payee DFSP name
- Transaction ID
- Status (dropdown)
- Amount
- Currency
- Transaction Date From (with calendar icon)
- Transaction Date To (with calendar icon)

A table below lists the transaction details:

Start Time (UTC)	Completed Time (UTC)	Transaction ID ↑	Payer Id	Payee Id	Payee DFSP Id	Payee DFSP Name	Amount	Currency	Status
2020-07-22 11:01:19	2020-07-22 11:01:32	c9b34ebd-dc5c...	27710101999	27710306999	in03tn06	Gorilla Bank	215	TZS	COMPLETED
2020-07-22 08:24:05	2020-07-22 08:24:23	3c158a60-9689...	27710101999	27710306999	in03tn06	Gorilla Bank	199	TZS	COMPLETED
