Ablipay SDK

Why we built the AbliPay SDK

- Designed for our use case for Ablipay
  - Automated load testing was a primary design goal. Designed to support the Mojaloop Performance Workstream by enabling repeatable, high-throughput load testing.
  - ALS is intentionally excluded. Only quoting, transfers, and fulfillment.
  - Implemented in Go to leverage lightweight concurrency (goroutines) for efficient high-throughput transaction processing and load generation.
- Not intended to replace the official JavaScript Mojaloop SDK; rather, it is a lightweight alternative optimized for ISO 20022 integrations and performance testing.
- Includes CLI utilities, an integrated ILP generator, Helm charts, and a built-in K6 load-testing tool.

What's in it

- The four flows:
  - POST/PUT /quotes,
  - POST/PUT /transfers, plus /callbacks/quotes|transfers|errors
- ILP generation built as another app — embedded as VrfctnOfTerms, forwarded to the Mojaloop Hub
  CORS, request/metrics tracking
- Onboarding DFSP tools
- Ships with Helm charts (charts/ablipay-sdk) and a load-testing CLI (apps/load-testing) in the same monorepo

How to try it / where it fits

- Clone ablipay-sdk-polyrepo => https://github.com/mojaloop/ablipay-sdk-polyrepo
  - Deploy the Helm chart to your cluster
  - Hit POST /quotes with an ISO 20022 body → watch it round-trip through ILP and back or run the CLI auto_send K6 tool
  - Further improvements are still coming
    - mTLS support using EasyRSA
    - Improved onboarding documentation
    - Additional SDK capabilities
