Workstream Reports & Progress Against Roadmap

Paul Makin

Where We Are, Where We're Going

Summary

- **Steady progress**, some major initiatives still in active development
- **Approaching “completion”:** IaC Lite, MCM integration, performance tuning, supply chain security improvements and the 17.3.0 release work
- **TigerBeetle** integration has advanced significantly but still depends on integration testing and staged adopter validation before it can be said to be production-ready
- Automation of the **QA framework**, **PISP 2.0** and **LEI integration** are all still works in progress
- **Full details:** https://community.mojaloop.io/active-workstreams

Workstreams: 1/4

- **Participation tools** has seen the refactoring of MCM and the WS is now supporting its integration into IaC and IaC Lite.
- **Deployment tools**: IaC Lite nearing completion, works with on-prem and AWS.
- The **QA Framework** is being translated into a machine-readable format; currently one (of six) pillars is ready for testing and validation, initially against IaC Lite deployments.
- **LEI Addressing**, led by GLEIF, has defined a new approach for MSMEs – particularly relevant for cross-border merchants. Currently working towards a PoC.

Workstreams: 2/4

- **PISP 2.0** has progressed rapidly; the base set of user stories are nearing completion. Workshop after MojaCom to establish additional use cases to implement.
- **Localisation** has seen not just the translation of all of our documentation into French, but also the establishment of a framework to help ensure the two versions remain in lock step, and also to support further languages, according to demand.
- **ISO20022** awaiting formal evaluation of Mojaloop's proposed new messages. A new focus on ISO 20022's limited support for APIs and process definitions has emerged.

New Contributor Onboarding Experience: The PISP Workstream

Yui Kanchalai

Workstreams: 3/4

- **Mojaloop Evolution:** TigerBeetle integration approaching code completion, with focus moving to testing. Support for migration is seen as crucial. Additional sub-workstreams focusing onre-factored reporting and on the implementation of Settlement V3 are expected to become more prominent.
- **Performance** has been demonstrated at around 2,000 TPS. Recent work has focused on improving the reproducibility of published benchmark results across adopter environments; discrepancies have now been resolved.
- The **Forensic Audit** infrastructure is now available; work now moves to updating the codebase to use it (logging auditable events) and providing tools to examine the audit logs.

Mojaloop and TigerBeetle: An Update

Lewis Daly

Workstreams: 4/4

- **Platform Quality and Security** directed significant effort to countering potential attacks discovered through the use of new AI tools, with the industry-wide supply chain affected. Significant security improvemnets have resulted. Team has now returned to routine vulnerability management.
- **Core and Releases** is ready to release Mojaloop V17.3.0, which includes a range of stability and performance improvements, and fixes for long-running resource leaks identified through extended performance testing. Performance remains comparable with 17.2.0 despite the introduction of additional security measures such as Istio and mutual TLS. Planning for Version 18 is also underway, with emphasis on extensive adopter validation of the TigerBeetle-based architecture before production release.

Progress against the Roadmap

Mojaloop 5 Year Roadmap

- Adopted March 2026
- Sets out short, medium and long term goals
- Based on an extensive analysis of payment industry trends
- Available here:

mojaloop foundation

Short Term Release Schedule

Mojaloop 17.2.0

Performance Improvements
Improvements to FX and Interscheme
Improved Logging
Simplified Deployment Tools
Re-architected DFSP Onboarding Tools

MojaCom 30
March 2026

Mojaloop 17.3.0

Performance Improvements
Standardised Logging
Support for Forensic Audit
PISP 2.0 Support
LEI Support for Merchants
Dispute Management Portal

Security Improvements

MojaCom 31
July 2026

Mojaloop 18.0.0

Migration to TigerBeetle
New Accounting Model
Settlement V3
Reporting Portal

Extending Mojaloop Beyond the Core

- **Mojaloop should evolve from a core switch to an ecosystem platform.**
- Establish an **Overlay Marketplace** to make community-developed capabilities discoverable and reusable.
- Focus community governance on **compliance, certification and interoperability** rather than developing every feature in the Core.
- Prioritise overlays that deliver the greatest deployment value: Finance/Business Operations Portal, ISO 8583 ATM integration, Merchant Payments, TTK, Dispute Management, Offline Payments
- Allow System Integrators to contribute and maintain differentiating functionality while protecting compatibility with the Core.

mojaloop foundation

Inclusion Requires Offline Payments

- **Offline payments should be treated as an inclusion capability, not a niche feature.**
- Connectivity gaps are structural, making offline capability essential for equitable access.
- Implement offline as a **bounded overlay/sub-scheme**, with deferred validation, transaction and time limits, controlled reconciliation
- Mojaloop should support adopters through CICO integration while avoiding changes to the Core.
- Key challenges remain around implementation cost, regulation, governance and risk management

mojaloop foundation

Extend Transaction Processing

Strengthen pre-validation and richer payment capabilities.

- Continue promoting Mojaloop's **Agreement of Terms (AoT)** model as a more robust alternative to single-phase payment models.
- Extend discovery to exchange richer information for fraud prevention, merchant assurance and cross-border automation.
- Keep AoT optional for domestic payments but retain it for complex cross-border scenarios.
- Enhance Request-to-Pay with recurring payments, flexible payment timing, customer controls and support for emerging services such as BNPL.

Preparing for the Next Generation of Payments

Position Mojaloop for future payment ecosystems

- Support regional and global cross-border interconnection (DRPP, Nexus, SWIFT, PAPSS, etc.) through technical integration rather than prescribing business models.
- Prepare for **Post-Quantum Cryptography**, prioritising protection of stored transaction data against “Harvest Now, Decrypt Later” attacks while planning migration of communications security.

Medium Term Strategic Recommendations

Key priorities for the Mojaloop Community

- Build an ecosystem of certified overlay services rather than expanding the Core.
- Treat offline capability as a strategic inclusion requirement delivered through overlays.
- Invest in richer pre-validation, discovery and Request-to-Pay capabilities to support cross-border payments and advanced payment services.
- Enable regional interoperability and begin planning for post-quantum security to ensure long-term resilience.

Medium Term Roadmap

Support Offline Payments PoC

ISO 20022 Engagement With SWIFT CBPR+, IP+

Overlay Marketplace

Pre-Validation Alignment With BIS CPMI

Technical Support for Cross-Border/Regional Interconnects: NEXUS, SWIFT, TCIB, PAPSS

Enhance RTP to Support Richer Business Models

Cross-Border Support for MSMEs

Migrate to Post-Quantum Crypto

2026

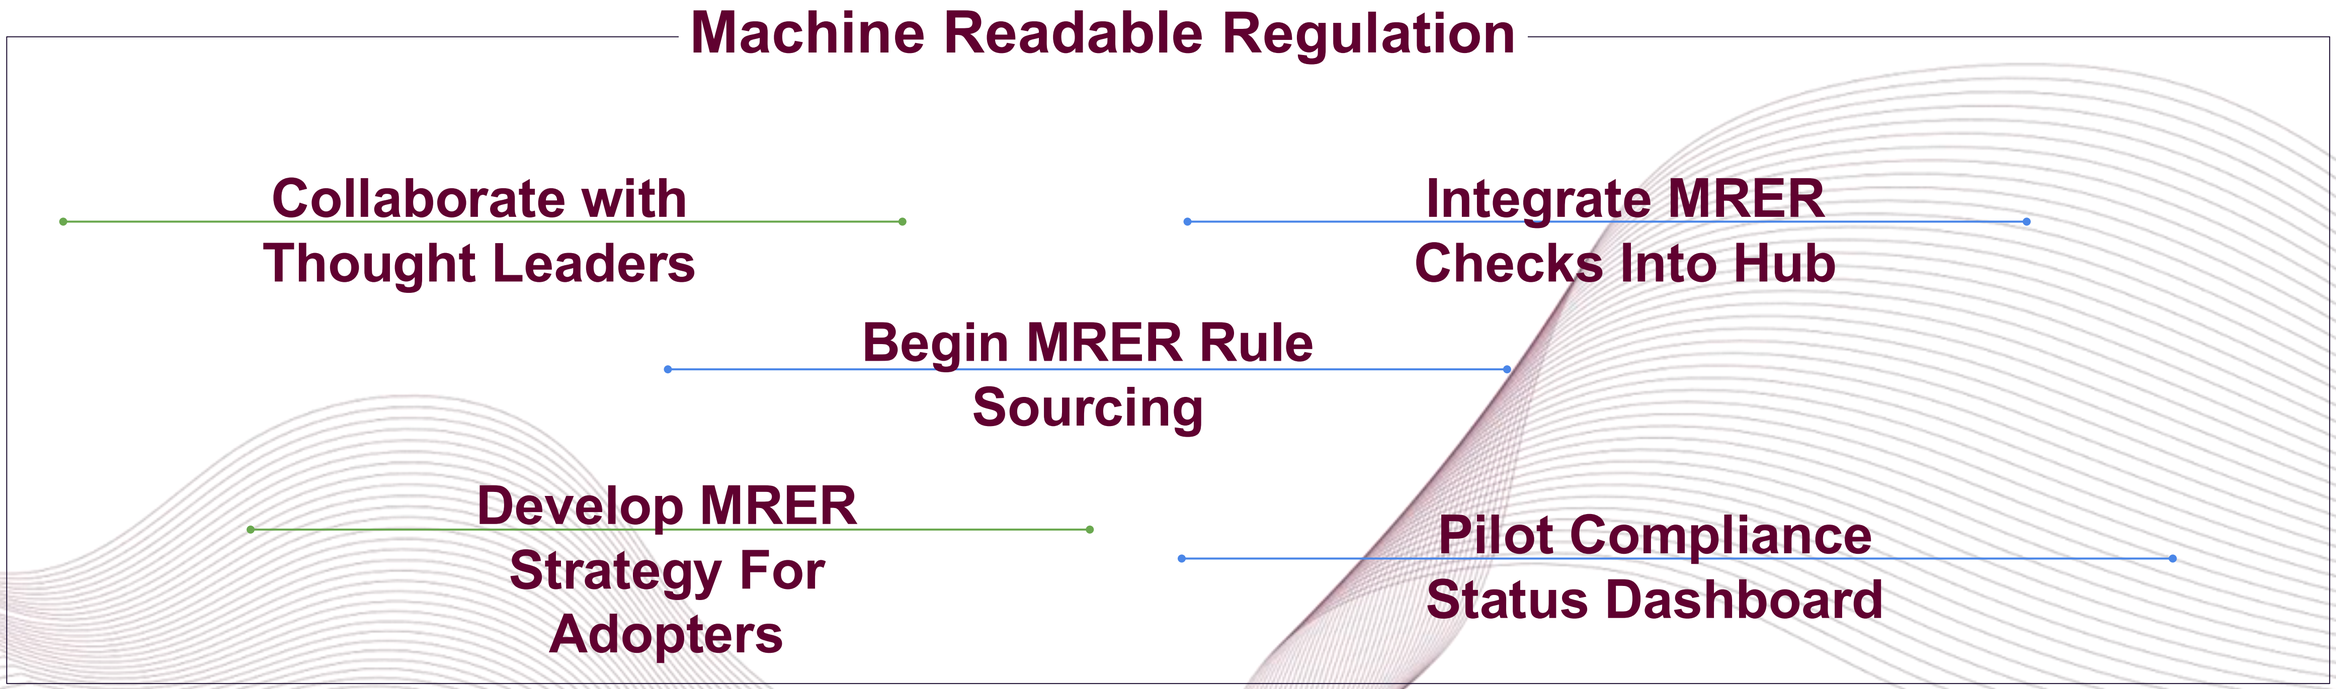

2027

2028

Compliance: Machine-Readable Regulation

- **Machine-Readable Regulation (MRER)** is moving from research into practical adoption, with significant initiatives underway from regulators (EU, Bank of England, BIS), academia (Cambridge RGP/RegGenome), and industry (ISDA DRR/CDM).
- These approaches transform traditional rulebooks into **structured, executable rules**, reducing interpretation effort, accelerating scheme deployment, and enabling continuous compliance and regulatory reporting.
- Although payments ecosystems have yet to adopt MRER widely, the direction of travel is clear and highly relevant to Mojaloop and its adopters.
- **Strategic priorities for Mojaloop** include integrating machine-readable rules into deployment and transaction processing, supporting automated compliance reporting, collaborating with leading MRER initiatives, and validating the approach through a focused proof of concept.

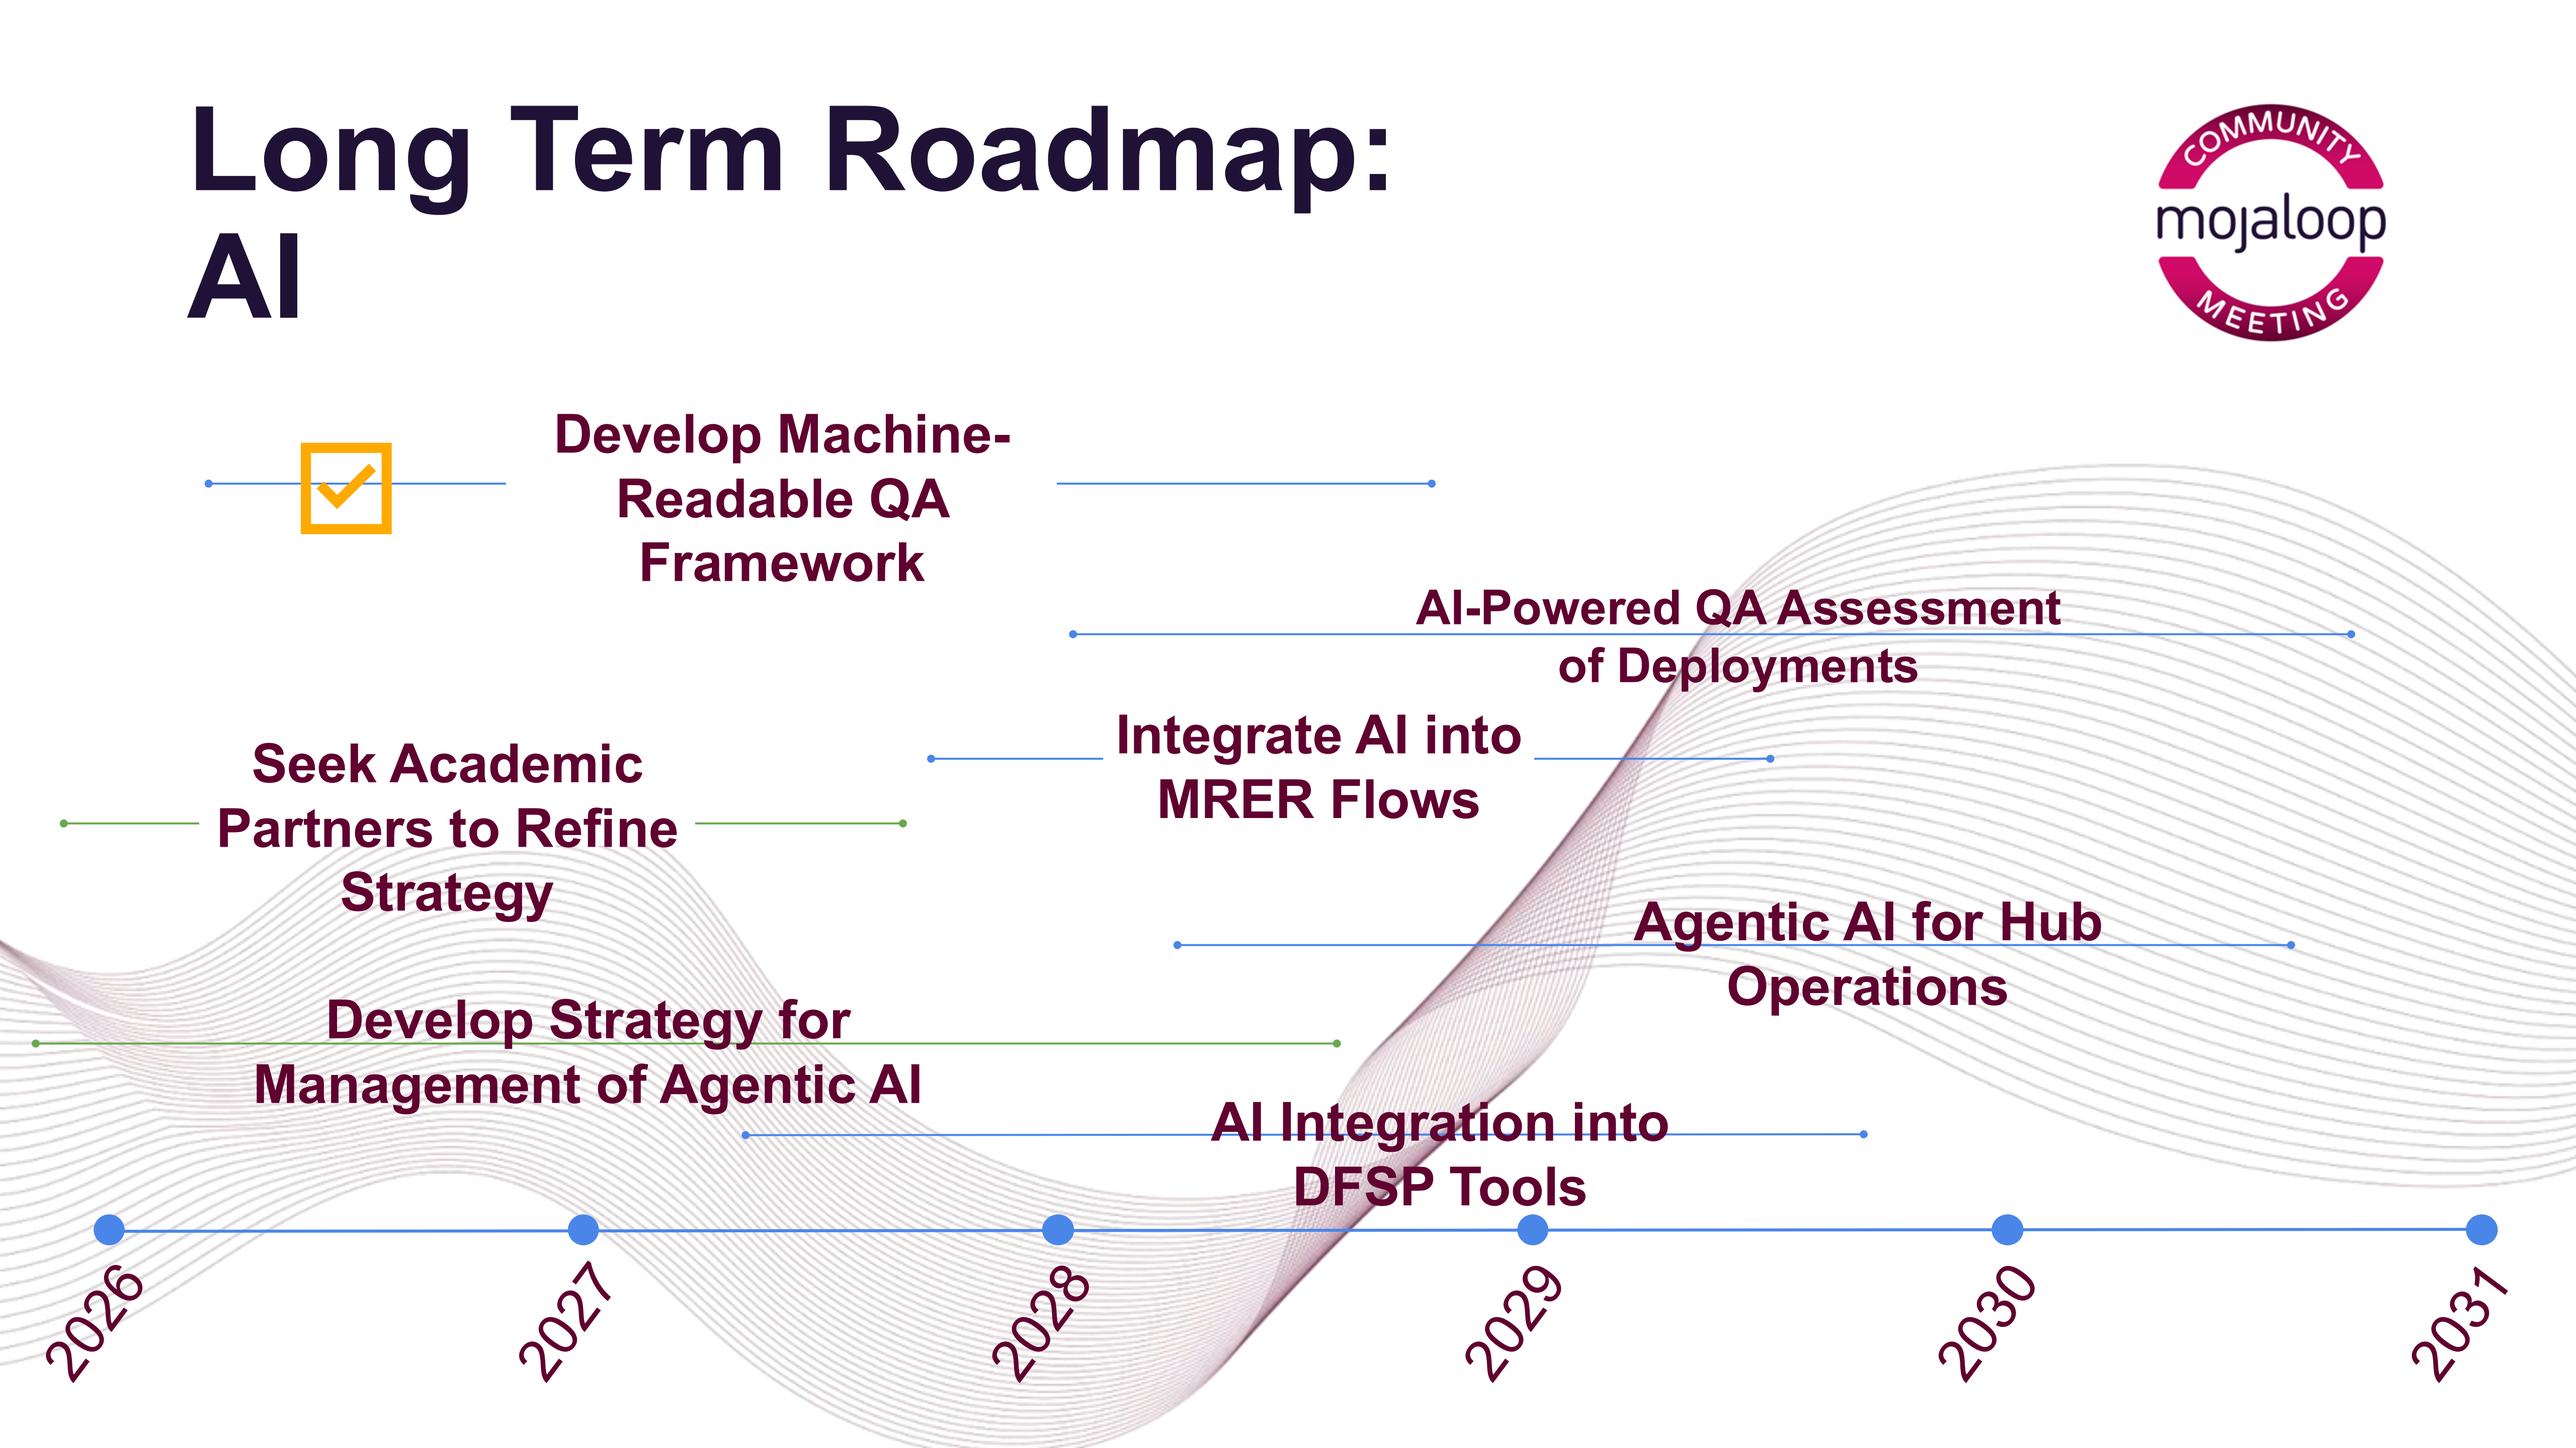

Long Term Roadmap: Compliance

AI: Strategic Opportunity for Mojaloop

- **Agentic AI** potentially presents a significant long-term opportunity to evolve Mojaloop towards a more autonomous, self-managing payments ecosystem.
- Example applications include **hub operations**, **liquidity and settlement management**, **technical operations**, **system resilience**, **compliance**, and **automated QA/release management**, reducing operational cost while improving resilience and governance.
- Safe adoption requires **strong governance**, with AI grounded in trusted data and tools, operating within defined boundaries and subject to transparent oversight.
- **Machine-readable regulation** could enable continuous compliance monitoring and simulation of regulatory change, supporting evidence-based governance for both hubs and DFSPs.
- **Recommendation:** Establish a Mojaloop AI working group to develop an adoption strategy, explore partnerships (including academia), and evaluate the combined potential of Agentic AI and Machine-Readable Regulation, while taking a cautious, evidence-based approach to deployment.

Long Term Roadmap: AI
